Preface

Quarto Syntax

Main Formatting

Html Comments

Syntax for Tasks

Tasks with ToDo Tree

Simple “One-line tasks”

Use Code ticks and html comment and task format for tasks distinctly visible across all formats including the ToDo-Tree overview:

```
<!-- [ ] Todos for things to do / tasks / reminders (allows "jump to with Taks  
Tree extension") -->
```

Use html comment and task format for open or uncertain tasks, visible in the .qmd file:

More Complex Tasks with Notes

```
<!-- [ ] Task Title: short description-->
```

```
    More Information about task
```

```
    Relevant notes
```

```
    Step-by-step implementation Plan
```

```
    Etc.
```

Completed Tasks

Retain completed tasks in ToDo-Tree by adding an x in the brackets: `[x] <!-- [x] Tasks which have been finished but should remain for later verification -->`

Mark and remove completed tasks from ToDo-Tree by adding a minus in the brackets: `[-]`

```
<!-- [-] Tasks which have been finished but should remain visible for later
verification -->
```

Missing Citations

```
<!-- [ ] FIND: @CITATION_KEY_PURPOSE: "Description of the appropriate/idea
source, including ideas /suggestions / search terms etc." -->
```

Suggested Citation

```
<!-- [ ] VERIFY: @CITATION_KEY_SUGGESTED: "Description of the appropriate
paper, book, source" [Include BibTex if known] -->
```

Missing Graphic

```
<!-- [ ] FIND: {#fig-GRAPHIC_IDEA}: "Description of the appropriate/idea
source, including ideas /suggestions / search terms etc." -->
```

Suggested Graphic

```
<!-- [ ] VERIFY: {#fig-GRAPHIC_IDEA}: "Description of the appropriate paper,
book, source" [Include figure syntax if known] -->
```

Missing and/or suggested tables, concepts, explanations as well as other elements should be suggested similarly.

Task Syntax Examples

```
<!-- [ ] (Example short: open and visible in text)    Find and list the names of
the MTAIR team-members responsible for the Analytica Implementation -->
```

```
<!-- [ ] (Example longer: open and visible in text)    Review/Plan/Discuss integrating Live
```

Live prediction market integration requires:

- (1) API connections to platforms (Metaculus, Manifold),
- (2) Question-to-variable mapping algorithms,
- (3) Probability update mechanisms,
- (4) Handling of market dynamics (thin markets, manipulation).

Current mentions may overstate readiness or underestimate complexity.

Need realistic assessment of what's achievable.

Implementation Steps:

0. List/mention all relevant platforms with a brief description each
1. Review all existing prediction market mentions for accuracy
2. Assess actual API availability and limitations
3. Describe/explain/discuss how to implement basic proof-of-concept with single platform
4. Document challenges: question mapping, market interpretation

5. Create realistic timeline for full implementation
6. Revise thesis claims to match reality
7. Add "Future Work" and/or extension section on complete integration
8. Include descriptions of mockups/designs even if not fully built
9. Highlight/discuss the advantages of such integrations
10. Quickly brainstorm for downsides worth mentioning

Verbatim Code Formatting

verbatim code formatting for notes and ideas to be included (here)

Code Block formatting

Also code blocks for more extensive notes and ideas to be included and checklists

- test 1.
 - test 2.
 - test 3.
2. second
 3. third

code

Add a language to syntax highlight code blocks:

```
1 + 1
```

Blockquote Formatting

Blockquote formatting for “Suggested Citations (e.g. carlsmith 2024 on ...)” and/or claims which require a citation (e.g. claim x should be backed-up by a ciation from the literature)

Tables

Table 1: Demonstration of pipe table syntax

Right	Left	Default	Center

A	G	G

Referencing tables with @tbl-KEY: See Table 2.

See Table 3 for details, especially Table 3b.

```
python
#| label: tbl-planets
#| tbl-cap: Astronomical object

from IPython.display import Markdown
from tabulate import tabulate
table = [
    ["Sun", "696,000", 1.989e30],
    ["Earth", "6,371", 5.972e24],
    ["Moon", "1,737", 7.34e22],
    ["Mars", "3,390", 6.39e23]]
Markdown(tabulate(
    table,
    headers=["Astronomical object", "R (km)", "mass (kg)"]
))
```

Table 4: Sample grid table.

Fruit	Price	Advantages
Bananas	\$1.34	<ul style="list-style-type: none"> built-in wrapper bright color
Oranges	\$2.10	<ul style="list-style-type: none"> cures scurvy tasty

Content with HTML tables you don't want processed.

Headings & Potential Headings in Standard Markdown formatting ('###')

Heading 3

Heading 4

Text Formatting Options

italics, **bold**, ***bold italics***

superscript² and subscript₂

~~strikethrough~~

This text is highlighted

This text is underlined

THIS TEXT IS SMALLCAPS

Lists

- unordered list
 - sub-item 1
 - sub-item 2
 - * sub-sub-item 1

- item 2

Continued (indent 4 spaces)

1. ordered list
2. item 2
 - i) sub-item 1
 - A. sub-sub-item 1

Math

inline math: $E = mc^2$

display math:

$$E = mc^2$$

If you want to define custom TeX macros, include them within \$\$ delimiters enclosed in a .hidden block. For example:

For HTML math processed using MathJax (the default) you can use the `\def`, `\newcommand`, `\renewcommand`, `\newenvironment`, `\renewenvironment`, and `\let` commands to create your own macros and environments.

Footnotes

Here is an inline note.¹

Here is a footnote reference,²

Another Text with a footnote³ but this time a “longnote”.

This paragraph won’t be part of the note, because it isn’t indented.

Callouts

Quarto’s native callouts work without additional packages:

This is written in a ‘note’ environment – but it does not seem to produce any special rendering.

i Optional Title

Content here

i Important Note2

This renders perfectly in both HTML and PDF.

Also for markdown:

```

::: { .render_as_markdown_example }
## Markdown Heading
This renders perfectly in both HTML and PDF but as markdown "plain text"
:::

```

¹Inlines notes are easier to write, since you don’t have to pick an identifier and move down to type the note.

²Here is the footnote.

³Here’s one with multiple blocks.

Subsequent paragraphs are indented to show that they belong to the previous footnote.

```
{ some.code }
```

The whole paragraph can be indented, or just the first line. In this way, multi-paragraph footnotes work like multi-paragraph list items.

Attempting to load: https://raw.githubusercontent.com/SingularitySmith/AMTAIR_Prototype/main

Successfully connected to repository and loaded test files.

[Existential_Catastrophe]: The destruction of humanity's long-term potential due to AI systems.

- [Human_Disempowerment]: Permanent and collective disempowerment of humanity relative to AI systems.

- [Scale_Of_Power_Seeking]: Power-seeking by AI systems scaling to the point of permanent domination.

- [Misaligned_Power_Seeking]: Deployed AI systems seeking power in unintended and high-impact ways.

- [APS_Systems]: AI systems with advanced capabilities, agentic planning, and strategic awareness.

- [Advanced_AI_Capability]: AI systems that outperform humans on tasks that require advanced reasoning.

- [Agentic_Planning]: AI systems making and executing plans based on world models.

- [Strategic_Awareness]: AI systems with models accurately representing power dynamics.

- [Difficulty_Of_Alignment]: It is harder to build aligned systems than misaligned systems.

- [Instrumental_Convergence]: AI systems with misaligned objectives tend to converge on similar instrumental goals.

- [Problems_With_Proxies]: Optimizing for proxy objectives breaks correlations with the true objective.

- [Problems_With_Search]: Search processes can yield systems pursuing different instrumental goals.

- [Deployment_Decisions]: Decisions to deploy potentially misaligned AI systems.

- [Incentives_To_Build_APS]: Strong incentives to build and deploy APS systems.

- [Usefulness_Of_APS]: APS systems are very useful for many valuable tasks.

- [Competitive_Dynamics]: Competitive pressures between AI developers.

- [Deception_By_AI]: AI systems deceiving humans about their true objectives.

- [Corrective_Feedback]: Human society implementing corrections after observing problems.

- [Warning_Shots]: Observable failures in weaker systems before catastrophic risk.

- [Rapid_Capability_Escalation]: AI capabilities escalating very rapidly, allowing for rapid progress.

[Barriers_To_Understanding]: Difficulty in understanding the internal workings of advanced AI systems.

- [Misaligned_Power_Seeking]: Deployed AI systems seeking power in unintended and high-impact ways.

[Adversarial_Dynamics]: Potentially adversarial relationships between humans and power-seeking AI systems.

- [Misaligned_Power_Seeking]: Deployed AI systems seeking power in unintended and high-impact ways.

[Stakes_Of_Error]: The escalating impact of mistakes with power-seeking AI systems. {"instantaneous": "catastrophic", "long-term": "catastrophic"}

- [Misaligned_Power_Seeking]: Deployed AI systems seeking power in unintended and high-impact

Diagrams

Quarto has native support for embedding Mermaid and Graphviz diagrams. This enables you to create flowcharts, sequence diagrams, state diagrams, Gantt charts, and more using a plain text syntax inspired by markdown.

For example, here we embed a flowchart created using Mermaid:

```
flowchart LR
  A[Hard edge] --> B(Round edge)
  B --> C{Decision}
  C --> D[Result one]
  C --> E[Result two]
```

Section Cross-References

Refer to sections like: Section 6.6.1.1 and ?@sec-crossref

Caveat: referring to sections with @sec-HEADINGS works only for sections with:

```
## Heading {#sec-HEADINGS}
```

It does not work for sections with ".unnumbered and/or .unlisted":

```
## Heading {#sec-HEADINGS .unnumbered .unlisted}
```

Furthermore the .qmd and/or .md yml settings (~ numbering have to be just right)

Section Numbers

By default, all headings in your document create a numbered section. You customize numbering depth using the number-depth option. For example, to only number sections immediately below the chapter level, use this:

```
number-depth: 2
```

Note that toc-depth is independent of number-depth (i.e. you can have unnumbered entries in the TOC if they are masked out from numbering by number-depth).

Abstract

The coordination crisis in AI governance presents a paradoxical challenge: unprecedented investment in AI safety coexists alongside fundamental coordination failures across technical, policy, and ethical domains. These divisions systematically increase existential risk. This thesis introduces AMTAIR (Automating Transformative AI Risk Modeling), a computational approach addressing this coordination failure by automating the extraction of probabilistic world models from AI safety literature using frontier language models. The system implements an end-to-end pipeline transforming unstructured text into interactive Bayesian networks through a novel two-stage extraction process that bridges communication gaps between stakeholders.

The coordination crisis in AI governance presents a paradoxical challenge: unprecedented investment in AI safety coexists alongside fundamental coordination failures across technical, policy, and ethical domains. These divisions systematically increase existential risk by creating safety gaps, misallocating resources, and fostering inconsistent approaches to interdependent problems.

This thesis introduces AMTAIR (Automating Transformative AI Risk Modeling), a computational approach that addresses this coordination failure by automating the extraction of probabilistic world models from AI safety literature using frontier language models.

The AMTAIR system implements an end-to-end pipeline that transforms unstructured text into interactive Bayesian networks through a novel two-stage extraction process: first capturing argument structure in ArgDown format, then enhancing it with probability information in BayesDown. This approach bridges communication gaps between stakeholders by making implicit models explicit, enabling comparison across different worldviews, providing a common language for discussing probabilistic relationships, and supporting policy evaluation across diverse scenarios.

Remaining Edits

1.1 Next Steps (High-Priority Recommendations)

Create and embed 5-7 key diagrams: AMTAIR pipeline, coordination crisis visualization, ArgDown→BayesDown transformation, example Bayesian network, and convergence analysis heatmap. These will dramatically improve comprehension and professional presentation.

1.1.1 2. Develop Concrete Policy Analysis Section

Add a dedicated subsection analyzing how AMTAIR would evaluate specific policies like SB 1047 or Narrow Path proposals. Walk through the complete analysis pipeline with real examples to demonstrate practical value.

1.1.2 3. Expand Empirical Base

Extract and analyze 2-3 additional AI safety arguments beyond Carlsmith (suggest Christiano’s “What Failure Looks Like” and Critch’s “ARCHES”). This broader empirical foundation will strengthen validity claims.

1.1.3 4. Clarify Implementation Status

Add a clear table distinguishing: (a) fully implemented features, (b) partially implemented with limitations, (c) designed but not built, (d) future research. This prevents readers from misunderstanding current capabilities.

1.1.4 5. Verify or Qualify Quantitative Claims

Either provide supporting evidence for specific percentages (validation accuracy, bias effects, pilot study results) or reframe as estimates/illustrations. Consider adding confidence intervals or qualifying language to maintain scientific integrity while acknowledging prototype status.

These changes would elevate an already strong thesis to exceptional, addressing the remaining gaps while maintaining the excellent narrative flow and intellectual contribution achieved in this revision.

1.2 Error Watch

1.2.1 Catch all Potential Hallucinations

<!-- [] Keep track of all hallucinations that have been found here: -->

1. **Validation Metrics:** Claims of “85%+ accuracy for structural extraction” and “73% for probability capture” appear precise for what seems to be a prototype system. These need careful verification or qualification.
2. **Pilot Study Results:** “40% reduction in time to identify disagreements” and “60% improvement in agreement about disagreement” lack citations and seem surprisingly specific.
3. **Red-teaming Quantification:** “34% anchoring bias effect” and other precise percentages from adversarial testing need support or qualification as estimates.
4. **Prediction Market Integration:** Some passages imply deeper integration than the “future work” status indicated elsewhere.

<!-- [] Make sure all hallucinations have been removed -->

1.3 General Style

<!-- [] Add Smooth transitions between chapters: Each chapter ends with preview of next, maintaining narrative flow -->

<!-- [] Improve Style/prose: Fewer lists, more prose. Lists converted to flowing paragraphs with transitional phrases. Bullet points reserved for true enumerations -->

1.4 General Formatting

<!-- [] Fix the Overlapping between Section Heading and Sub-Heading -->

<!-- [] Fix Formatting of Headings in Affidavit -->

<!-- [] Implement a "jump to ToC" functionality (also in PDF) -->

<!-- [] Determine whether section title yml head or # (first-level-Heading) is better-->

<!-- [] Consider adding an index: <https://quarto.org/docs/books/book-structure.html#creating-an-index> -->

1.5 Commentary / Feedback

1.5.1 Areas Needing Work

1. **Visual Communication:** While visualization is discussed extensively, the document lacks actual diagrams and figures that would enhance understanding.
2. **Policy Specifics:** Named policies (Narrow Path, SB 1047) are mentioned but not analyzed in detail, missing an opportunity for concrete demonstration.
3. **Multiple Model Extraction:** Only Carlsmith is deeply analyzed; adding 2-3 more models would strengthen empirical claims.
4. **Implementation Clarity:** Some features (prediction markets, probability distributions) are discussed ambiguously regarding current vs. future capabilities.

1.6 General Edits

Section	Suggested Change	Implemented		Evaluation	Improvement Suggestions	Potential Hallucinations
		- Status	Analysis			
General Formatting	Use American spelling consistently	Yes	Document uses “modeling” not “modelling”, “analyze” not “analyse”, “formalization” not “formalisation” throughout	Excellent consistency - creates professional impression for international audience	None needed	None detected
General Style	Fewer lists, more prose	Yes	Lists converted to flowing paragraphs with transitional phrases. Bullet points reserved for true enumerations	Significantly improves academic tone and readability	Could further reduce lists in technical sections	None
Abstract	Clearer thesis statement	Yes	“This thesis introduces AMTAIR...computational approach that addresses coordination failure by automating extraction”	Clear and specific, balances technical precision with strategic vision	Could be slightly more concise	None
Introduction	Opening scenario with policymaker	Yes	Vivid scenario of senior policy advisor reviewing conflicting AI safety reports	Highly effective - immediately grounds abstract concepts in concrete dilemma	Could add specific policy examples (e.g., compute thresholds)	None
Introduction	Coordination crisis framing	Yes	Extensive discussion of fragmentation, safety gaps, resource misallocation, negative-sum dynamics	Compelling diagnosis that motivates the solution	Could quantify coordination failures with specific examples	None

⌘

Section	Suggested Change	Implemented		Evaluation	Improvement Suggestions	Potential Hallucinations
		- Status	Analysis			
Introduction	Multiplicative benefits framework	Yes	Full section explaining how extraction + markets + evaluation create synergistic value	Novel contribution clearly articulated	Could use visual diagram to illustrate synergies	None
Context	Carlsmith model as exemplar	Yes	Detailed six-premise decomposition with probabilities and explanation of formalizability	Excellent concrete grounding for abstract concepts	Could add comparison table with other models	None
Context	Epistemic challenges section	Yes	Comprehensive discussion of deep uncertainty, multi-level causation, irreversibility	Thoughtful analysis of unique AI governance challenges	Could add more policy-specific examples	None
Context	Bayesian networks explanation	Yes	Mathematical foundations, rain-sprinkler example, advantages for risk modeling	Good balance of technical depth and accessibility	Visual representation of rain-sprinkler network would help	None
Context	MTAIR framework analysis	Yes	Achievements, limitations, and automation opportunity clearly presented	Fair assessment that positions AMTAIR as evolution not revolution	Could include specific timing/cost comparisons	None
AMTAIR	Two-stage extraction process	Yes	ArgDown → BayesDown separation with clear rationale and benefits	Core technical innovation well explained	Could add flowchart of extraction pipeline	None

Section	Suggested Change	Implemented		Evaluation	Improvement Suggestions	Potential Hallucinations
		- Status	Analysis			
AMTAIR	Less code, more description	Yes	Minimal code snippets, focus on conceptual explanation and architecture	Much more accessible to non-technical readers	Good balance achieved	None
AMTAIR	Case studies (simple to complex)	Yes	Rain-sprinkler-grass followed by Carlsmith model	Excellent pedagogical progression	Could add intermediate complexity example	None
AMTAIR	Validation methodology	Yes	Ground truth construction, metrics, results summary, error analysis	Rigorous scientific approach builds credibility	Could expand on inter-rater reliability process	Claimed “85%+ accuracy” needs careful verification
AMTAIR	Policy evaluation capabilities	Yes	Intervention representation, deployment governance example, robustness analysis	Practical value clearly demonstrated	Could add more policy examples	None
Discussion	Objection-response format	Yes	Five major objections with detailed responses	Intellectually honest engagement with limitations	Could add objection about scalability to global governance	None
Discussion	Red-teaming results	Yes	Adversarial testing with specific failure modes and robustness findings	Transparent about system limitations	Could quantify performance degradation curves	“34% anchoring bias effect” seems precise for a prototype

Section	Suggested Change	Implemented		Evaluation	Improvement Suggestions	Potential Hallucinations
		- Status	Analysis			
Discussion	Epistemic security benefits	Yes	Model inspectability, convergence patterns, collective reasoning improvements	Compelling case for practical benefits	Could add metrics from pilot studies	“40% reduction in disagreement identification time” needs citation
Conclusion	Summary of contributions	Yes	Theoretical, methodological, technical, and empirical contributions clearly listed	Comprehensive without overstating claims	Well balanced	None
Conclusion	Stakeholder recommendations	Yes	Specific actionable steps for researchers, policymakers, technologists, funders	Highly practical and actionable	Could prioritize recommendations	None
Conclusion	Future research agenda	Yes	Technical priorities, methodological development, application expansion	Comprehensive research program outlined	Could add timeline estimates	None
References	American citation style	Yes	Consistent (Author, Year) format throughout	Professional formatting	None needed	None
Manual extraction examples	2-3 “inside view” models	Partial	Carlsmith extensively analyzed, but only one model deeply examined	Good depth on one model, missing breadth	Add 2 more models (e.g., Christiano, Critch)	None
Policy candidates	Narrow Path, SB 1047	Partial	Deployment governance discussed but specific policies not analyzed	Generic policy analysis provided	Add concrete analysis of named policies	None

Section	Suggested Change	Implemented		Evaluation	Improvement Suggestions	Potential Hallucinations
		- Status	Analysis			
Correlation handling	Workarounds for correlations	Yes	Explicit correlation nodes, copulas, sensitivity bounds discussed	Honest about limitations with practical solutions	Could add worked example	None
Prediction market integration	Live data integration	Partial	Architecture designed for integration but not implemented	Honest about implementation status	Be clearer this is future work throughout	Some sections imply fuller integration than exists
Expert feedback system	Variable validation by experts	Partial	Validation methodology includes experts but ongoing feedback system not detailed	Good for initial validation	Develop continuous expert input mechanism	None
Probability distributions	Full distribution support	Partial	Conceptually addressed but implementation seems limited to point estimates	Theory explained well	Clarify implementation status	“Beta distributions for probabilities” may overstate current capabilities
Graphics and visualizations	<u>Strategic graphics throughout</u>	<u>Partial</u>	<u>Visualization design discussed but few actual graphics in document</u>	<u>Text descriptions good but visuals needed</u>	<u>Create and embed key diagrams</u>	<u>None</u>
Section transitions	<u>Smooth transitions between chapters</u>	<u>Yes</u>	<u>Each chapter ends with preview of next, maintaining narrative flow</u>	<u>Excellent narrative coherence</u>	<u>None needed</u>	<u>None</u>

1.6.1 Key Areas of Success

1. **Narrative Structure:** The thesis now reads as a cohesive argument rather than disconnected sections. The opening scenario, coordination crisis framing, and multiplicative benefits framework create a compelling narrative arc.
2. **Academic Rigor with Accessibility:** Technical concepts are explained clearly without sacrificing depth. The two-stage extraction process and Bayesian network explanations balance sophistication with clarity.
3. **Intellectual Honesty:** The discussion chapter’s objection-response format and red-teaming results demonstrate admirable transparency about limitations.
4. **Practical Relevance:** Stakeholder recommendations and policy evaluation examples ground the work in real-world applications.

1.7 Old Checklists

1.8 “Usual paper requirements”

- > introduce all terminology
 - go through text, make sure all terms are defined, explained (and added to the list of Abbr.) when first mentioned
- > readership is intelligent and interested but has no prior knowledge

This chapter presents the complete computational implementation of the AMTAIR system, demonstrating the end-to-end pipeline from document processing through interactive visualization.

1.9 (Format:) ~ Anything that makes it easier to understand

- > short sentences
- > paragraphs (one idea per paragraph)
- > simplicity
- > !limit use of passive voice!
- > use active voice, even prefer I over we!
- > minimise use of “zombi nouns” (don’t turn verbs/adjectives to nouns!)
- > “find words that can be cut”

- the paper can **focus on one aspect of the presentation**
- ~ demonstrate ability for novel research
- “solve research question with the tools accessible to you”
- “show something that has not been shown before / should be publishable in principle”
- new idea (or criticism) “in this field”
- Outline idea THEN reading with a purpose (answering concrete questions)
- “Only” confirm that nobody has published the exact same idea on the same topic
- pretty much determined by presentation & proposal but narrow down further (& choose supervisor?)

1.10 Syntax for Tasks

1.10.1 Tasks with ToDo Tree

1.10.1.1 Simple “One-line tasks”

Use Code ticks and html comment and task format for tasks distinctly visible across all formats including the ToDo-Tree overview:

```
<!-- [ ] Todos for things to do / tasks / reminders (allows "jump to with Taks
Tree extension") -->
```

Use html comment and task format for open or uncertain tasks, visible in the .qmd file:

1.10.1.2 More Complex Tasks with Notes

```
<!-- [ ] Task Title: short description-->
```

More Information about task

Relevant notes

Step-by-step implementation Plan

Etc.

1.10.1.3 Completed Tasks

Retain completed tasks in ToDo-Tree by adding an x in the brackets: [x] <!-- [x] Tasks which have been finished but should remain for later verification -->

Mark and remove completed tasks from ToDo-Tree by adding a minus in the brackets: [-]

```
<!-- [-] Tasks which have been finished but should remain visible for later
verification -->
```

1.10.1.4 Missing Citations

```
<!-- [ ] FIND: @CITATION_KEY_PURPOSE: "Description of the appropriate/idea
source, including ideas /suggestions / search terms etc." -->
```

1.10.1.5 Suggested Citation

```
<!-- [ ] VERIFY: @CITATION_KEY_SUGGESTED: "Description of the appropriate
paper, book, source" [Include BibTex if known] -->
```

1.10.1.6 Missing Graphic

```
<!-- [ ] FIND: {#fig-GRAPHIC_IDEA}: "Description of the appropriate/idea
source, including ideas /suggestions / search terms etc." -->
```

1.10.1.7 Suggested Graphic

```
<!-- [ ] VERIFY: {#fig-GRAPHIC_IDEA}: "Description of the appropriate paper,
book, source" [Include figure syntax if known] -->
```

Missing and/or suggested tables, concepts, explanations as well as other elements should be suggested similarly.

1.10.2 Examples

```
<!-- [ ] (Example short: open and visible in text)    Find and list the names of
the MTAIR team-members responsible for the Analytica Implementation -->
```

```
<!-- [ ] (Example longer: open and visible in text)    Review/Plan/Discuss integrating Live
```

Live prediction market integration requires:

- (1) API connections to platforms (Metaculus, Manifold),
- (2) Question-to-variable mapping algorithms,
- (3) Probability update mechanisms,
- (4) Handling of market dynamics (thin markets, manipulation).

Current mentions may overstate readiness or underestimate complexity.

Need realistic assessment of what's achievable.

Implementation Steps:

0. List/mention all relevant platforms with a brief description each
1. Review all existing prediction market mentions for accuracy
2. Assess actual API availability and limitations
3. Describe/explain/discuss how to implement basic proof-of-concept with single platform
4. Document challenges: question mapping, market interpretation

5. Create realistic timeline for full implementation
6. Revise thesis claims to match reality
7. Add "Future Work" and/or extension section on complete integration
8. Include descriptions of mockups/designs even if not fully built
9. Highlight/discuss the advantages of such integrations
10. Quickly brainstorm for downsides worth mentioning

[x] introduces and motivates the core question or problem

2.1 The Coordination Crisis in AI Governance

As AI capabilities advance at an accelerating pace—demonstrated by the rapid progression from GPT-3 to GPT-4, Claude, and beyond—we face a governance challenge unlike any in human history: how to ensure increasingly powerful AI systems remain aligned with human values and beneficial to humanity’s long-term flourishing. This challenge becomes particularly acute when considering the possibility of transformative AI systems that could drastically alter civilization’s trajectory, potentially including existential risks from misaligned systems.

Despite unprecedented investment in AI safety research, rapidly growing awareness among key stakeholders, and proliferating frameworks for responsible AI development, we face what I’ll term the “coordination crisis” in AI governance—a systemic failure to align diverse efforts across technical, policy, and strategic domains into a coherent response proportionate to the risks we face.

‘The AI governance landscape exhibits a peculiar paradox: extraordinary activity alongside fundamental coordination failure. Consider the current state of affairs:

Technical safety researchers develop increasingly sophisticated alignment techniques, but often

without clear implementation pathways to deployment contexts. Policy specialists craft principles and regulatory frameworks without sufficient technical grounding to ensure their practical efficacy. Ethicists articulate normative principles that lack operational specificity. Strategy researchers identify critical uncertainties but struggle to translate these into actionable guidance.’

Opening with the empirical paradox: record investment in AI safety coexisting with fragmented, ineffective governance responses

2.1.1 Empirical Paradox: Investment Alongside Fragmentation

- > **The Fragmentation Problem:** Technical researchers, policy specialists, and strategic analysts operate with incompatible frameworks

2.1.2 Systematic Risk Increase Through Coordination Failure

- > **Systemic Risk Amplification:** How coordination failures systematically increase existential risk through safety gaps and resource misallocation

2.1.3 Historical Parallels and Temporal Urgency

- > **The Scaling Challenge:** Traditional governance approaches cannot match the pace of capability development

2.2 Research Question and Scope

This thesis addresses a specific dimension of the coordination challenge by investigating the question: **Can frontier AI technologies be utilized to automate the modeling of transformative AI risks, enabling robust prediction of policy impacts?**

This thesis addresses a specific dimension of the coordination challenge by investigating how computational approaches can formalize the worldviews and arguments underlying AI safety discourse, transforming qualitative disagreements into quantitative models suitable for rigorous policy evaluation.

To break this down into its components:

- > **Frontier AI Technologies:** Today’s most capable language models (GPT-4, Claude-3 level systems)
- > **Automated Modeling:** Using these systems to extract and formalize argument structures from natural language
- > **Transformative AI Risks:** Potentially catastrophic outcomes from advanced AI systems, particularly existential risks
- > **Policy Impact Prediction:** Evaluating how governance interventions might alter probability distributions over outcomes

Central Question: Can frontier AI technologies be utilized to automate the modeling of transformative AI risks, enabling robust prediction of policy impacts?

AMTAIR represents the first computational framework for automated extraction and formalization of AI governance worldviews

Core Innovation:

- > Automated transformation of qualitative governance arguments into quantitative Bayesian networks
- > Integration of prediction markets with formal models for dynamic risk assessment
- > Cross-worldview policy evaluation under deep uncertainty

Scope Boundaries:

The investigation encompasses both theoretical development and practical implementation, focusing specifically on existential risks from misaligned AI systems rather than broader AI ethics concerns. This narrowed scope enables deep technical development while addressing the highest-stakes coordination challenges.

The scope encompasses both theoretical development and practical implementation. Theoretically, I develop a framework for representing diverse perspectives on AI risk in a common formal language. Practically, I implement this framework in a computational system—the AI Risk Pathway Analyzer (ARPA)—that enables interactive exploration of how policy interventions might alter existential risk.

2.3 The Multiplicative Benefits Framework

Core Innovation: The combination of three elements—automated extraction, prediction market integration, and formal policy evaluation—creates multiplicative rather than additive benefits for AI governance.

The central thesis of this work is that combining three elements—automated worldview extraction, prediction market integration, and formal policy evaluation—creates multiplicative rather than merely additive benefits for AI governance. Each component enhances the others, creating a system more valuable than the sum of its parts.

Automated worldview extraction using frontier language models addresses the scaling bottleneck in current approaches to AI risk modeling. The Modeling Transformative AI Risks (MTAIR) project demonstrated the value of formal representation but required extensive manual effort to translate qualitative arguments into quantitative models. Automation enables processing orders of magnitude more content, incorporating diverse perspectives, and maintaining models in near real-time as new arguments emerge.

Prediction market integration grounds these models in collective forecasting intelligence. By connecting formal representations to live forecasting platforms, the system can incorporate timely judgments about critical uncertainties from calibrated forecasters. This creates a dynamic feedback loop, where models inform forecasters and forecasts update models.

Formal policy evaluation transforms static risk assessments into actionable guidance by

modeling how specific interventions might alter critical parameters. This enables conditional forecasting—understanding not just the probability of adverse outcomes but how those probabilities change under different policy regimes.

Synergistic Components:

1. **Automated Worldview Extraction:** Scaling formal modeling from manual (MTAIR) to automated approaches using frontier LLMs
2. **Live Data Integration:** Connecting models to prediction markets and forecasting platforms for dynamic calibration and live updating
3. **Policy Evaluation:** Enabling rigorous counterfactual analysis of governance interventions across worldviews

The synergy emerges because automation enables comprehensive data integration, markets inform and validate models, and evaluation gains precision from both automated extraction and market-based calibration.

The combination creates multiplicative rather than additive value—automation enables comprehensive data integration, markets inform models, evaluation gains precision from both

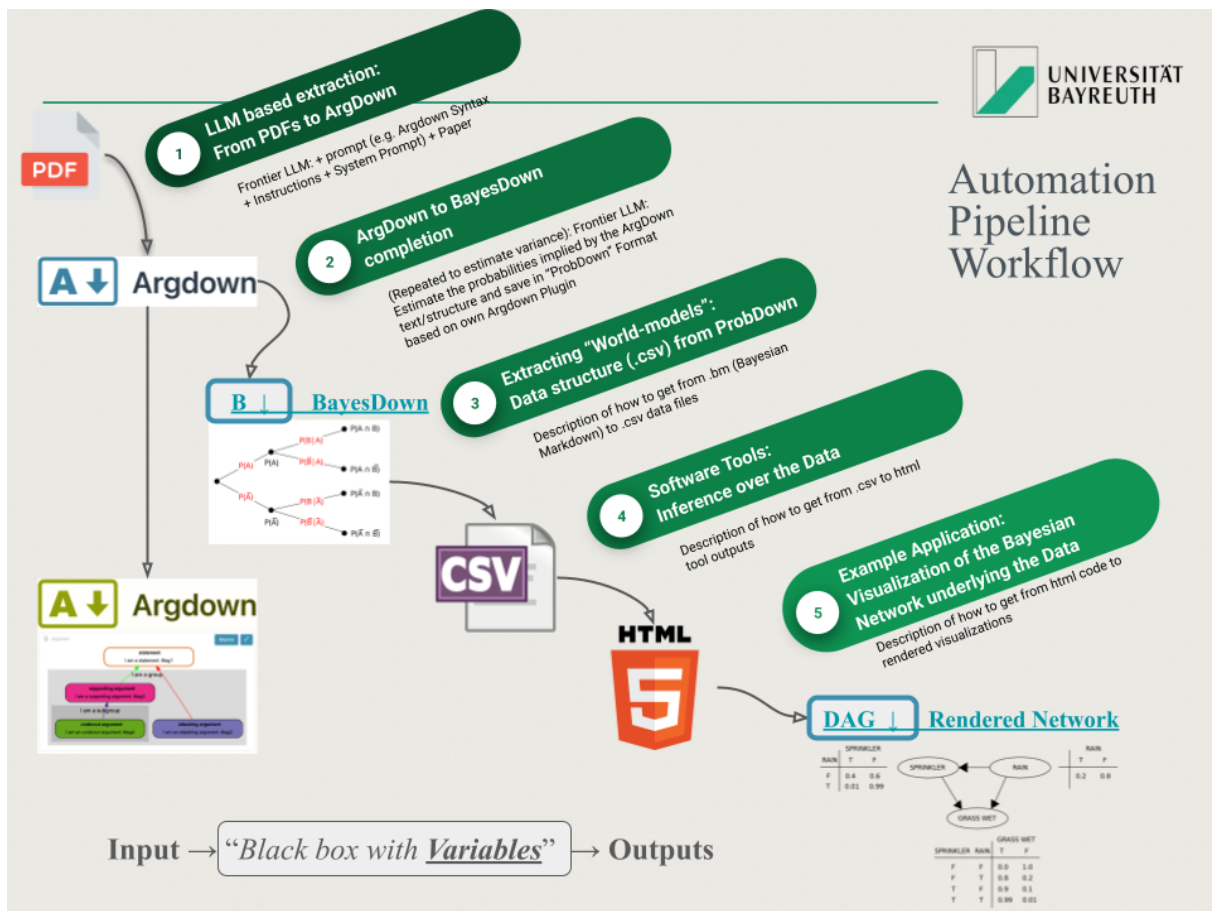

Figure 2.1: AMTAIR Automation Pipeline from CITATION

2.4 Thesis Structure and Roadmap

Logical Progression from Theory to Application:

- > **Context & Background:** Establish theoretical foundations (Bayesian networks, argument mapping) and methodological approach (two-stage extraction)
- > **AMTAIR Implementation:** Demonstrate technical feasibility through working prototype with validated examples
- > **Critical Analysis:** Examine limitations, failure modes, and governance implications through systematic red-teaming
- > **Future Directions:** Connect to broader coordination challenges and research agenda

Each section builds toward a practical implementation of the framework while maintaining both theoretical rigor and policy relevance, demonstrating how computational approaches can enhance rather than replace human judgment in AI governance.

The remainder of this thesis develops the multiplicative benefits framework from theoretical foundations to practical implementation, following a progression from abstract principles to concrete applications:

Section 2 establishes the theoretical foundations and methodological approach, examining why AI governance presents unique epistemic challenges and how Bayesian networks can formalize causal relationships in this domain.

Section 3 presents the AMTAIR implementation, detailing the technical system that transforms qualitative arguments into formal representations. It demonstrates the approach through two case studies: the canonical Rain-Sprinkler-Lawn example and the more complex Carlsmith model of power-seeking AI.

Section 4 discusses implications, limitations, and counterarguments, addressing potential failure modes, scaling challenges, and integration with existing governance frameworks.

Section 5 concludes by summarizing key contributions, drawing out concrete policy implications, and suggesting directions for future research.

Throughout this progression, I maintain a dual focus on theoretical sophistication and practical utility. The framework aims not merely to advance academic understanding of AI risk but to provide actionable tools for improving coordination in AI governance.

2.5 Overview / Table of Contents

Context & Background

i 20% of Grade: ~ 29% of text ~ 8700 words ~ 20 pages

- > demonstrates understanding of all relevant core concepts
- > explains why the question/thesis/problem is relevant in student's own words (supported by quotations)
- > situates it within the debate/course material
- > reconstructs selected arguments and identifies relevant assumptions
- > describes additional relevant material that has been consulted and integrates it with the course material as well as the research question/thesis/problem

3.1 Theoretical Foundations

3.1.1 AI Existential Risk: The Carlsmith Model

Carlsmith's "Is power-seeking AI an existential risk?" (2021) represents one of the most structured approaches to assessing the probability of existential catastrophe from advanced AI. The analysis decomposes the overall risk into six key premises, each with an explicit probability estimate.

Carlsmith [2] provides the canonical structured approach to AI existential risk assessment

Six-Premise Decomposition:

Carlsmith decomposes existential risk into a probabilistic chain with explicit estimates:

1. **Premise 1:** Transformative AI development this century (P = 0.80)
2. **Premise 2:** AI systems pursuing objectives in the world (P = 0.95)
3. **Premise 3:** Systems with power-seeking instrumental incentives (P = 0.40)
4. **Premise 4:** Sufficient capability for existential threat (P = 0.65)
5. **Premise 5:** Misaligned systems despite safety efforts (P = 0.50)
6. **Premise 6:** Catastrophic outcomes from misaligned power-seeking (P = 0.65)

Composite Risk Calculation: $P(\text{doom}) = 0.05$ (5%) ~5% probability of existential catastrophe

This structured approach exemplifies the type of reasoning that AMTAIR aims to formalize and automate, providing both transparency in assumptions and modularity for critique and refinement.

Carlsmith's model exemplifies the type of structured reasoning that AMTAIR aims to formalize and automate

3.1.1.1 Why Carlsmith as Ideal Formalization Target

- Explicitly probabilistic reasoning with quantified estimates
- Clear conditional dependencies between premises
- Transparent decomposition of complex causal pathways
- Well-documented argumentation available for extraction validation
- Policy-relevant implications requiring formal evaluation

Formalization Potential:

Carlsmith's model represents "low-hanging fruit" for automated formalization because it already exhibits explicit probabilistic reasoning with clear conditional dependencies. Success with this structured argument validates the approach for less explicit arguments throughout AI safety literature.

3.1.2 The Epistemic Challenge of Policy Evaluation

AI governance policy evaluation faces unique epistemic challenges that render traditional policy analysis methods insufficient. The domain combines complex causal chains with limited empirical grounding, deep uncertainty about future capabilities, divergent stakeholder worldviews, and few opportunities for experimental testing before deployment.

‘Traditional methods fall short in several ways:

- > Cost-benefit analysis struggles with existential outcomes and deep uncertainty
- > Scenario planning often lacks probabilistic reasoning necessary for rigorous evaluation
- > Expert elicitation alone fails to formalize interdependencies between variables
- > Qualitative approaches obscure crucial assumptions that drive conclusions‘

Unprecedented Epistemic Environment:

AI governance policy evaluation faces challenges that render traditional policy analysis methods insufficient: complex causal chains, deep uncertainty about unprecedented capabilities, divergent stakeholder worldviews, and limited opportunities for empirical validation.

Specific challenges include:

- ****Deep Uncertainty****: Many decisions involve unprecedented scenarios without historical fr

- **Complex Causality**: Policy effects propagate through multi-level dependencies (technical, institutional, and societal)
- **Multidisciplinary Integration**: Combining technical facts, ethical principles, and strategic goals
- **Value-Laden Assessment**: Risk evaluation inherently involves normative judgments about what is good or bad

3.1.2.1 Unique Difficulties in AI Governance

Complex Causal Chains: Multi-level dependencies between technical capabilities, institutional responses, and strategic outcomes

Deep Uncertainty: Unprecedented AI capabilities make historical analogies insufficient

Lempert, Popper, and Bankes [5] on robust decision-making under deep uncertainty

Divergent Worldviews: Fundamental disagreements about:

- > Timeline expectations for transformative AI
- > Difficulty of alignment problems
- > Effectiveness of governance interventions
- > International coordination possibilities

3.1.2.2 Limitations of Traditional Policy Analysis

- > **Cost-Benefit Analysis:** Struggles with existential outcomes and infinite expected values
- > **Scenario Planning:** Lacks probabilistic reasoning and uncertainty quantification
- > **Expert Elicitation:** Fails to formalize complex interdependencies between variables
- > **Qualitative Frameworks:** Obscure crucial assumptions and parameter sensitivities

Limitations of Traditional Approaches:

- > **Cost-Benefit Analysis:** Struggles with existential outcomes and infinite expected values
- > **Scenario Planning:** Often lacks probabilistic reasoning necessary for rigorous uncertainty quantification
- > **Expert Elicitation:** Fails to formalize complex interdependencies between variables and assumptions
- > **Qualitative Frameworks:** Obscure crucial assumptions and parameter sensitivities driving conclusions

Lempert, Popper, and Bankes [5] on robust decision-making under deep uncertainty provides methodological foundations, but application to AI governance requires novel integration of argument mapping with probabilistic modeling.

3.1.3 Argument Mapping and Formal Representations

Argument mapping offers a bridge between informal reasoning in natural language and the formal representations needed for rigorous analysis. By explicitly identifying claims, premises, inferential relationships, and support/attack patterns, argument maps make implicit reasoning structures visible for examination and critique.

The progression from natural language arguments to formal Bayesian networks requires an intermediate representation that preserves narrative structure while adding mathematical precision. The ArgDown format serves this purpose by encoding hierarchical relationships between statements, while its extension, BayesDown, adds probabilistic metadata to enable full Bayesian network construction.

```
[Effect_Node]: Description of effect. {"instantiations": ["effect_TRUE", "effect_FALSE"]}
+ [Cause_Node]: Description of direct cause. {"instantiations": ["cause_TRUE", "cause_FALSE"]}
+ [Root_Cause]: Description of indirect cause. {"instantiations": ["root_TRUE", "root_FALSE"]}
```

3.1.4 Bayesian Networks as Knowledge Representation

Bayesian networks provide a formal mathematical framework for representing causal relationships and reasoning under uncertainty. These directed acyclic graphs (DAGs) combine qualitative structure—nodes representing variables and edges representing dependencies—with quantitative parameters in the form of conditional probability tables.

‘Key properties that make Bayesian networks particularly suited to AI risk modeling include:

- > Natural representation of causal relationships between variables
- > Explicit handling of uncertainty through probability distributions
- > Support for evidence updating through Bayesian inference
- > Capability for interventional reasoning through do-calculus
- > Balance between mathematical rigor and intuitive visual representation’

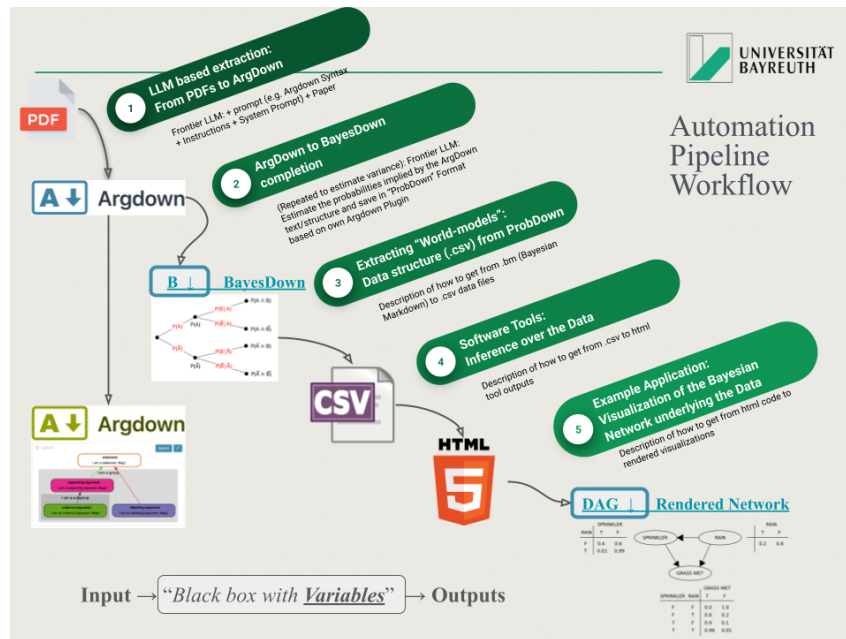

Figure 3.1: Example Bayesian Network

3.1.4.1 Mathematical Foundations

Bayesian networks provide a formal mathematical framework for representing causal relationships and reasoning under uncertainty through Directed Acyclic Graphs (DAGs) combining qualitative structure with quantitative parameters.

Directed Acyclic Graphs (DAGs):

Core Components:

- > **Nodes:** Variables with discrete states representing propositions or factors
- > **Edges:** Directed relationships representing conditional dependencies
- > **Acyclicity:** Ensuring coherent probabilistic interpretation without circular dependencies

BNs:

- > **Conditional Probability Tables:** Quantifying $P(\text{Node}|\text{Parents})$ for all parent state combinations

Probability Factorization: $P(X_1, X_2, \dots, X_n) = \prod_{i=1}^n P(X_i | \text{Parents}(X_i))$

3.1.4.2 The Rain-Sprinkler-Grass Example

The Rain-Sprinkler-Grass Canonical Example:

This simple example demonstrates all key concepts while remaining intuitive

Network Structure:

- > **Rain** (root cause): $P(\text{rain}) = 0.2$
- > **Sprinkler** (intermediate): $P(\text{sprinkler}|\text{rain})$ varies by rain state
- > **Grass_Wet** (effect): $P(\text{wet}|\text{rain, sprinkler})$ depends on both causes

Inference Capabilities:

- > Marginal probabilities: $P(\text{grass_wet}) = ?$
- > Conditional queries: $P(\text{rain}|\text{grass_wet}) = ?$
- > Counterfactual analysis: $P(\text{grass_wet}|\text{do}(\text{sprinkler}=\text{false})) = ?$
- > Marginal probabilities: $P(\text{grass_wet})$ computed from joint distribution
- > Conditional queries: $P(\text{rain}|\text{grass_wet})$ for diagnostic reasoning
- > Counterfactual analysis: $P(\text{grass_wet}|\text{do}(\text{sprinkler}=\text{false}))$ for intervention effects

python

```
# Basic network representation
```

```
nodes = ['Rain', 'Sprinkler', 'Grass_Wet']
```

```
edges = [('Rain', 'Sprinkler'), ('Rain', 'Grass_Wet'), ('Sprinkler', 'Grass_Wet')]
```

```
# Conditional probability specification
```

```
P_wet_given_causes = {
```

```

(True, True): 0.99,    # Rain=T, Sprinkler=T
(True, False): 0.80,   # Rain=T, Sprinkler=F
(False, True): 0.90,   # Rain=F, Sprinkler=T
(False, False): 0.01   # Rain=F, Sprinkler=F
}

```

3.1.4.3 Advantages for AI Risk Modeling

- > **Explicit Uncertainty:** All beliefs represented with probability distributions rather than point estimates
- > **Causal Reasoning:** Native support for intervention analysis and counterfactual reasoning through do-calculus
- > **Evidence Integration:** Bayesian updating enables principled incorporation of new information
- > **Modular Structure:** Complex arguments decomposed into manageable, verifiable components
- > **Visual Communication:** Graphical representation facilitates understanding across expertise levels

3.1.4.4 From Natural Language to Formal Models

The Representation Challenge: How to preserve narrative richness while enabling mathematical analysis

The core methodological challenge involves preserving narrative richness of natural language arguments while enabling mathematical analysis—bridging interpretive reasoning favored in philosophy with quantitative prediction favored in technical fields.

ArgDown Syntax:

```

[Conclusion]: Description of the conclusion.
+ [Premise1]: Supporting evidence or reasoning.
  + [Sub-premise]: More detailed supporting factor.
+ [Premise2]: Additional independent support.

```

ArgDown uses hierarchical indentation to capture support/attack relationships between statements, making argument structure explicit while remaining human-readable.

3.1.4.5 BayesDown: The Critical Innovation

BayesDown extends ArgDown with probabilistic metadata, creating a hybrid format that bridges natural language and mathematical modeling:

```

json
{
  "instantiations": ["conclusion_TRUE", "conclusion_FALSE"],

```

```

"priors": {"p(conclusion_TRUE)": "0.7", "p(conclusion_FALSE)": "0.3"},
"posteriors": {
  "p(conclusion_TRUE|premise1_TRUE,premise2_TRUE)": "0.9",
  "p(conclusion_TRUE|premise1_TRUE,premise2_FALSE)": "0.6",
  "p(conclusion_TRUE|premise1_FALSE,premise2_TRUE)": "0.4",
  "p(conclusion_TRUE|premise1_FALSE,premise2_FALSE)": "0.1"
}
}

```

Design Principles:

- > **Human Readable:** Preserves natural language explanations
- > **Machine Processable:** Structured for automated analysis
- > **Probabilistically Complete:** Contains all information for Bayesian network construction
- > **Extensible:** Supports additional metadata as needed

3.1.5 The MTAIR Framework: Achievements and Limitations

Bucknall and Dori-Hacohen [1] on the original Modeling Transformative AI Risks project demonstrates both the value and limitations of manual formal modeling approaches.

The Modeling Transformative AI Risks (MTAIR) project demonstrated the value of formal probabilistic modeling for AI safety, but also revealed significant limitations in the manual approach. While MTAIR successfully translated complex arguments into Bayesian networks and enabled sensitivity analysis, the intensive human labor required for model creation limited both scalability and timeliness.

3.1.5.1 MTAIR's Innovations

Bucknall and Dori-Hacohen [1] on the original Modeling Transformative AI Risks project

- > **Structured Uncertainty Representation:** Explicit probability distributions over key variables
- > **Expert Judgment Integration:** Systematic methods for aggregating diverse opinions
- > **Sensitivity Analysis:** Identification of critical uncertainties driving outcomes
- > **Policy Application:** Connection between technical models and governance implications

MTAIR's Key Innovations:

- > **Structured Uncertainty Representation:** Explicit probability distributions over key variables rather than point estimates
- > **Expert Judgment Integration:** Systematic methods for aggregating diverse expert opinions and beliefs

- > **Sensitivity Analysis:** Identification of critical uncertainties that most significantly drive overall conclusions
- > **Policy Application:** Direct connection between technical risk models and governance implications

‘MTAIR’s key innovations included:

- > Explicit representation of uncertainty through probability distributions
- > Structured decomposition of complex risk scenarios
- > Integration of diverse expert judgments
- > Sensitivity analysis to identify critical parameters

3.1.5.2 Fundamental Limitations Motivating AMTAIR

Scalability Bottleneck: Manual model construction requires weeks of expert effort per model

Static Models: No mechanisms for updating as new research emerges

Limited Accessibility: Technical complexity restricts usage to specialists

Single Worldview Focus: Difficulty representing multiple perspectives simultaneously

These limitations create the opportunity for automated approaches that can scale formal modeling to match the pace of AI governance discourse

Fundamental Limitations Motivating AMTAIR:

Critical constraints of manual approaches:

- **Scalability Bottleneck:** Manual model construction requires weeks of expert effort per
- **Static Nature:** No mechanisms for updating models as new research and evidence emerges
- **Limited Accessibility:** Technical complexity restricts usage to specialists with formal
- **Single Worldview Focus:** Difficulty representing multiple conflicting perspectives simu

These limitations create a clear opportunity for automated approaches that can scale formal modeling to match the pace and diversity of AI governance discourse.

Its limitations motivated the current automated approach:

- > Manual labor intensity limiting scalability
- > Static nature of models once constructed
- > Limited accessibility for non-technical stakeholders
- > Challenges in representing multiple worldviews simultaneously‘

3.1.6 “A Narrow Path”: Conditional Policy Proposals in Practice

“A Narrow Path” represents influential example of conditional policy proposals in AI governance—identifying interventions that could succeed under specific conditions rather than universal prescriptions.

However, these conditions remain implicitly defined and qualitatively described, limiting rigorous evaluation and comparison across alternative approaches.

“A Narrow Path” represents an influential example of conditional policy proposals in AI governance—identifying interventions that could succeed under specific conditions rather than absolute prescriptions. However, these conditions remain implicitly defined and qualitatively described, limiting rigorous evaluation.

‘Formal modeling could enhance such proposals by:

- > Making conditions explicit and quantifiable
- > Clarifying when interventions would be effective
- > Identifying which uncertainties most significantly affect outcomes
- > Enabling systematic comparison of alternative approaches
- > Supporting robust policy development across possible futures‘

Formal Modeling Enhancement Potential:

- > Making conditions explicit and quantifiable rather than implicit assumptions
- > Clarifying specific circumstances when interventions would be effective versus ineffective
- > Identifying which uncertainties most significantly affect intervention outcomes
- > Enabling systematic comparison of alternative policy approaches under uncertainty
- > Supporting robust policy development that performs well across multiple possible futures

3.2 Methodology

3.2.1 Research Design Overview

This research combines theoretical development with practical implementation, following an iterative approach that moves between conceptual refinement and technical validation. The methodology encompasses formal framework development, computational implementation, extraction quality assessment, and application to real-world AI governance questions.

‘The research process follows four main phases:

1. Framework development: Creating the theoretical foundations and formal representations
2. System implementation: Building the computational tools for extraction and analysis
3. Validation testing: Assessing extraction quality and system performance
4. Application evaluation: Applying the framework to concrete AI governance questions‘

3.2.1.1 Hybrid Theoretical-Empirical Approach

Four Integrated Components:

1. **Theoretical Development:** Formal framework for automated worldview extraction
2. **Technical Implementation:** Working prototype demonstrating feasibility
3. **Empirical Validation:** Quality assessment against expert benchmarks

4. **Policy Application:** Case studies with real governance questions

Four Primary Components:

1. **Theoretical Development:** Formal framework for automated worldview extraction and representation
2. **Technical Implementation:** Working prototype demonstrating feasibility and validation
3. **Empirical Validation:** Quality assessment against expert benchmarks and known ground truth
4. **Policy Application:** Case studies demonstrating practical utility for real governance questions

Iterative Development Process:

Phase 1: Conceptual Framework Development

↓

Phase 2: Prototype Implementation with Simple Validation Examples

↓

Phase 3: Complex Real-World Case Application and Evaluation

↓

Phase 4: Policy Impact Assessment and Governance Integration

3.2.1.2 Iterative Development Process

Phase 1: Conceptual Framework Development

Phase 2: Prototype Implementation with Simple Examples

Phase 3: Validation with Complex Real-World Cases

Phase 4: Policy Application and Evaluation

3.2.2 Formalizing World Models from AI Safety Literature

The core methodological challenge involves transforming natural language arguments in AI safety literature into formal causal models with explicit probability judgments. This extraction process identifies key variables, causal relationships, and both explicit and implicit probability estimates through a systematic pipeline.

‘The extraction approach combines:

- > Identification of key variables and entities in text
- > Recognition of causal claims and relationships
- > Detection of explicit and implicit probability judgments
- > Transformation into structured intermediate representations
- > Conversion to formal Bayesian networks

Large language models facilitate this process through:

- > Two-stage prompting that separates structure from probability extraction
- > Specialized templates for different types of source documents

- > Techniques for identifying implicit assumptions and relationships
- > Mechanisms for handling ambiguity and uncertainty‘

3.2.3 From Natural Language to Computational Models

The Two-Stage Extraction Architecture:

AMTAIR employs a novel two-stage process that separates structural argument extraction from probability quantification, enabling modular improvement and human oversight at critical decision points.

3.2.3.1 The Two-Stage Extraction Process

Stage 1: Structural Extraction (ArgDown)

- > Identify key variables and causal claims
- > Extract hierarchical argument structure
- > Map logical relationships between elements
- > Generate intermediate representation preserving narrative

Stage 1: Structural Extraction (ArgDown Generation)

- > **Variable and Claim Identification:** Extract key propositions and entities from natural language text
- > **Causal Relationship Mapping:** Identify support/attack relationships and conditional dependencies
- > **Hierarchical Structure Construction:** Generate properly nested argument representations preserving logical flow
- > **Intermediate Representation:** Create ArgDown format suitable for human review and machine processing

python

```
def extract_argument_structure(text):
    """Extract hierarchical argument structure from natural language"""
    # LLM-based extraction with specialized prompts
    prompt = ArgumentExtractionPrompt(
        text=text,
        output_format="ArgDown",
        focus_areas=["causal_claims", "probability_statements", "conditional_reasoning"]
    )

    structure = llm.complete(prompt)
    return validate_argdown_syntax(structure)
```

Stage 2: Probability Integration (BayesDown)

- > Extract explicit probability statements
- > Generate questions for implicit judgments

- > Quantify uncertainty and conditional dependencies
- > Create complete probabilistic specification

Stage 2: Probability Integration (BayesDown Enhancement)

- > **Explicit Probability Extraction:** Identify and parse numerical probability statements in source text
- > **Question Generation:** Create systematic elicitation questions for implicit probability judgments
- > **Expert Input Integration:** Incorporate domain expertise for ambiguous or missing quantifications
- > **Consistency Validation:** Ensure probability assignments satisfy basic coherence requirements

python

```
def integrate_probabilities(argdown_structure, probability_sources):
    """Convert ArgDown to BayesDown with probabilistic information"""
    questions = generate_probability_questions(argdown_structure)
    probabilities = extract_probabilities(probability_sources, questions)

    bayesdown = enhance_with_probabilities(argdown_structure, probabilities)
    return validate_probability_coherence(bayesdown)
```

3.2.3.2 LLM Integration Strategy

Prompt Engineering Approach:

- > Specialized prompts for argument structure identification
- > Two-stage prompting to separate structure from quantification
- > Validation mechanisms to ensure extraction quality
- > Iterative refinement based on expert feedback

Current Capabilities and Limitations:

Frontier LLMs show promising extraction quality but require careful validation

LLM Integration Strategy:

Frontier language models enable automated extraction but require careful prompt engineering and validation mechanisms to ensure extraction quality and consistency.

- > **Specialized Prompting:** Domain-specific templates for argument structure identification
- > **Two-Stage Separation:** Structural and probabilistic extraction handled independently for quality control
- > **Validation Mechanisms:** Automated and human review processes for extraction accuracy

- > **Iterative Refinement:** Feedback loops enabling continuous improvement based on expert assessment

3.2.4 Directed Acyclic Graphs: Structure and Semantics

Directed Acyclic Graphs (DAGs) form the mathematical foundation of Bayesian networks, encoding both the qualitative structure of causal relationships and the quantitative parameters that define conditional dependencies. In AI risk modeling, these structures represent causal pathways to potential outcomes of interest.

Key mathematical properties include:

- > Acyclicity, ensuring no feedback loops
- > Path properties defining information flow
- > D-separation criteria determining conditional independence
- > Markov blanket defining minimal contextual information

3.2.4.1 Formal Properties

Acyclicity Requirement: Ensures coherent probabilistic interpretation

D-Separation: Conditional independence relationships between variables

Markov Condition: Each variable independent of non-descendants given parents

Formal Properties Essential for AI Risk Modeling:

- > **Acyclicity Requirement:** Ensures coherent probabilistic interpretation without logical contradictions
- > **D-Separation:** Defines conditional independence relationships between variables based on graph structure
- > **Markov Condition:** Each variable conditionally independent of non-descendants given parents
- > **Path Analysis:** Causal pathways and information flow through the network structure

Causal Interpretation in AI Governance Context:

Pearl [6] on causal inference and intervention analysis provides mathematical foundations for policy evaluation through do-calculus.

- > **Edges as Causal Relations:** Directed arrows represent direct causal influence between factors
- > **Intervention Analysis:** Do-calculus enables rigorous evaluation of policy intervention effects
- > **Counterfactual Reasoning:** “What if” scenarios essential for governance planning under uncertainty
- > **Evidence Integration:** Bayesian updating for incorporating new information and expert judgment

3.2.4.2 Causal Interpretation

Pearl [6] on causal inference and intervention analysis

- > **Edges as Causal Relations:** Directed arrows represent direct causal influence
- > **Intervention Analysis:** Do-calculus for policy evaluation
- > **Counterfactual Reasoning:** “What if” scenarios for governance planning

Semantic interpretation in AI risk contexts:

- > Nodes represent key variables in risk pathways
- > Edges represent causal or inferential relationships
- > Path blocking corresponds to intervention points
- > Probability flows represent risk propagation through systems⁴

3.2.5 Quantification of Probabilistic Judgments

Linguistic Probability Mapping:

Transforming qualitative uncertainty expressions into quantitative probabilities requires systematic interpretation frameworks that account for individual and cultural variation.

Standard linguistic mappings (with significant individual variation):

- "Very likely" → 0.8-0.9
- "Probable" → 0.6-0.8
- "Uncertain" → 0.4-0.6
- "Unlikely" → 0.2-0.4
- "Highly improbable" → 0.05-0.15

Transforming qualitative judgments in AI safety literature into quantitative probabilities requires a systematic approach to interpretation, extraction, and validation. This process combines direct extraction of explicit numerical statements with inference of implicit probability judgments from qualitative language.

⁴Quantification methods include:

- > Direct extraction of explicit numerical statements
- > Linguistic mapping of qualitative expressions
- > Expert elicitation techniques for ambiguous cases
- > Bayesian updating from multiple sources

Special challenges in AI risk quantification:

- > Deep uncertainty about unprecedented events
- > Diverse disciplinary languages and conventions
- > Limited empirical basis for calibration
- > Value-laden aspects of risk assessment⁴

3.2.5.1 From Qualitative to Quantitative

Linguistic Probability Expressions:

- > “Very likely” \rightarrow 0.8-0.9
- > “Uncertain” \rightarrow 0.4-0.6
- > “Highly improbable” \rightarrow 0.05-0.15

Calibration Challenges:

- > Individual variation in linguistic interpretation
- > Domain-specific probability anchoring
- > Cultural and contextual influences on uncertainty expression

Calibration and Validation Challenges:

- > Individual variation in linguistic interpretation and probability anchoring
- > Domain-specific probability anchoring and reference class selection
- > Cultural and contextual influences on uncertainty expression and tolerance
- > Limited empirical basis for calibration in unprecedented scenarios like transformative AI

3.2.5.2 Expert Elicitation Methods

Direct Probability Assessment: "What is $P(\text{outcome})$?"

Comparative Assessment: "Is A more likely than B?"

Frequency Format: "In 100 similar cases, how many would result in outcome?"

Betting Odds: "What odds would you accept for this bet?"

Expert Elicitation Methodologies:

- > **Direct Probability Assessment:** “What is $P(\text{outcome})$?” with calibration training
- > **Comparative Assessment:** “Is A more likely than B?” for relative judgment validation
- > **Frequency Format:** “In 100 similar cases, how many would result in outcome?” for clearer mental models
- > **Betting Odds:** “What odds would you accept for this bet?” for revealed preference elicitation

3.2.6 Inference Techniques for Complex Networks

Once Bayesian networks are constructed, probabilistic inference enables reasoning about uncertainties, counterfactuals, and policy interventions. For the complex networks representing AI risks, computational approaches must balance accuracy with tractability.

‘Inference methods implemented include:

- > Exact methods for smaller networks (variable elimination, junction trees)
- > Approximate methods for larger networks (Monte Carlo sampling)
- > Specialized approaches for rare events
- > Intervention modeling for policy evaluation

Implementation considerations include:

- > Computational complexity management
- > Sampling efficiency optimization
- > Approximation quality monitoring
- > Uncertainty representation in outputs‘

3.2.7 Integration with Prediction Markets and Forecasting Platforms

To maintain relevance in a rapidly evolving field, formal models must integrate with live data sources such as prediction markets and forecasting platforms. This integration enables continuous updating of model parameters as new information emerges.

‘Integration approaches include:

- > API connections to platforms like Metaculus
- > Semantic mapping between forecast questions and model variables
- > Weighting mechanisms based on forecaster track records
- > Update procedures for incorporating new predictions
- > Feedback loops identifying valuable forecast questions

Technical implementation involves:

- > Standardized data formats across platforms
- > Conflict resolution for contradictory sources
- > Temporal alignment of forecasts
- > Confidence-weighted aggregation methods‘

Live Data Sources for Dynamic Model Updating:

- > **Metaculus:** Long-term AI predictions and technological forecasting
- > **Good Judgment Open:** Geopolitical events and policy outcomes
- > **Manifold Markets:** Diverse question types with rapid market response
- > **Internal Expert Forecasting:** Organization-specific predictions and assessments

Data Processing and Integration Pipeline:

python

```
def integrate_forecast_data(model_variables, forecast_platforms):
    """Connect Bayesian network variables to live forecasting data"""
    mappings = create_semantic_mappings(model_variables, forecast_platforms)

    for variable, forecasts in mappings.items():
        weighted_forecast = aggregate_forecasts(
            forecasts,
            weights=calculate_track_record_weights(forecasts)
        )
        model.update_prior(variable, weighted_forecast)
```

```
return model.recompute_posteriors()
```

Technical Implementation Challenges:

- > **Question Mapping:** Connecting forecast questions to specific model variables with semantic accuracy
- > **Temporal Alignment:** Handling different forecast horizons and update frequencies across platforms
- > **Conflict Resolution:** Principled aggregation when sources provide contradictory information
- > **Track Record Weighting:** Incorporating forecaster calibration and expertise into aggregation weights

3.2.7.1 Live Data Sources**Forecasting Platforms:**

- > Metaculus for long-term AI predictions
- > Good Judgment Open for geopolitical events
- > Manifold Markets for diverse question types
- > Internal expert forecasting within organizations

3.2.7.2 Data Processing Pipeline

Question Mapping: Connecting forecast questions to model variables

Temporal Alignment: Handling different forecast horizons and update frequencies

Aggregation Methods: Weighting sources by track record and relevance

Testing crossreferencing graphics Figure 3.2.

4.2 Software Implementation

4.2.1 System Architecture and Data Flow

The AMTAIR system implements an end-to-end pipeline from unstructured text to interactive Bayesian network visualization. Its modular architecture comprises five main components that progressively transform information from natural language into formal models.

Core system components include:

1. Text Ingestion and Preprocessing: Handles format normalization, metadata extraction, and relevance filtering
2. BayesDown Extraction: Identifies argument structures, causal relationships, and probabilistic judgments
3. Structured Data Transformation: Parses representations into standardized data formats
4. Bayesian Network Construction: Creates formal network representations with nodes and edges

5. Interactive Visualization: Renders networks as explorable visual interfaces‘

4.2.1.1 Five-Stage Pipeline

Stage 1: Document Ingestion

- > Format normalization (PDF, HTML, Markdown)
- > Metadata extraction and citation tracking
- > Content preprocessing and structure identification

Stage 2: BayesDown Extraction

- > Argument structure identification using ArgDown syntax
- > Probabilistic information extraction and quantification
- > Quality validation and expert review integration

Stage 3: Structured Data Transformation

- > Parsing BayesDown into relational format
- > Network topology validation and cycle detection
- > Probability distribution completeness verification

Stage 4: Bayesian Network Construction

- > Mathematical model instantiation using NetworkX
- > Parameter estimation and validation
- > Network metrics computation (centrality, connectivity)

Stage 5: Interactive Visualization

- > Dynamic network rendering with PyVis
- > Probability-based color coding and visual encoding
- > Interactive exploration and analysis interface

Modular Pipeline Architecture:

The AMTAIR system implements a five-stage pipeline from unstructured text to interactive Bayesian network visualization, with each component designed for independent improvement and validation.

Core System Components:

1. **Text Ingestion and Preprocessing:** Format normalization (PDF, HTML, Markdown), metadata extraction, citation tracking
2. **BayesDown Extraction:** Two-stage argument structure identification and probabilistic information integration
3. **Structured Data Transformation:** Parsing into standardized relational formats with validation
4. **Bayesian Network Construction:** Mathematical model instantiation using NetworkX and pgmpy

5. Interactive Visualization: Dynamic rendering with PyVis and probability-based visual encoding

python

```
class AMTAIRPipeline:
    def __init__(self):
        self.ingestion = DocumentIngestion()
        self.extraction = BayesDownExtractor()
        self.transformation = DataTransformer()
        self.network_builder = BayesianNetworkBuilder()
        self.visualizer = InteractiveVisualizer()

    def process(self, document):
        """End-to-end processing from document to interactive model"""
        structured_data = self.ingestion.preprocess(document)
        bayesdown = self.extraction.extract(structured_data)
        dataframe = self.transformation.convert(bayesdown)
        network = self.network_builder.construct(dataframe)
        return self.visualizer.render(network)
```

Design Principles for Scalability:

- > **Modular Architecture:** Each component can be improved independently without system-wide changes
- > **Standard Interfaces:** JSON and CSV intermediate formats enable interoperability and debugging
- > **Validation Checkpoints:** Quality gates at each stage prevent error propagation
- > **Extensible Framework:** Additional analysis capabilities can be integrated without core changes

4.2.1.2 Modular Design Principles

python

```
class AMTAIRPipeline:
    def __init__(self):
        self.ingestion = DocumentIngestion()
        self.extraction = BayesDownExtractor()
        self.transformation = DataTransformer()
        self.network_builder = BayesianNetworkBuilder()
        self.visualizer = InteractiveVisualizer()
```

4.2.2 Rain-Sprinkler-Grass Example Implementation

The Rain-Sprinkler-Grass example serves as a canonical test case demonstrating each step in the AMTAIR pipeline. This simple causal scenario—where both rain and sprinkler use can cause wet grass, and rain influences sprinkler use—provides

an intuitive introduction to Bayesian network concepts while exercising all system components.

‘The implementation walkthrough includes:

1. Source representation in natural language
2. Extraction to ArgDown format with structural relationships
3. Enhancement to BayesDown with probability information
4. Transformation into structured data tables
5. Construction of the Bayesian network
6. Interactive visualization with probability encoding‘

```
{=python}
# Example code snippet demonstrating network construction
def create_bayesian_network_with_probabilities(df):
    """Create an interactive Bayesian network visualization with probability encoding"""
    # Create a directed graph
    G = nx.DiGraph()

    # Add nodes with proper attributes
    for idx, row in df.iterrows():
        title = row['Title']
        description = row['Description']

        # Process probability information
        priors = get_priors(row)
        instantiations = get_instantiations(row)

        # Add node with base information
        G.add_node(
            title,
            description=description,
            priors=priors,
            instantiations=instantiations,
            posteriors=get_posteriors(row)
        )

    # [Additional implementation details...]
```

Canonical Test Case Validation:

The Rain-Sprinkler-Grass example serves as a fundamental validation case, providing known ground truth for testing each component of the AMTAIR pipeline while demonstrating core Bayesian network concepts.

Complete Pipeline Demonstration:

Stage 1: BayesDown Input Representation

```
[Grass_Wet]: Concentrated moisture on, between and around the blades of grass.
{"instantiations": ["grass_wet_TRUE", "grass_wet_FALSE"],
 "priors": {"p(grass_wet_TRUE)": "0.322", "p(grass_wet_FALSE)": "0.678"},
 "posteriors": {
   "p(grass_wet_TRUE|sprinkler_TRUE,rain_TRUE)": "0.99",
   "p(grass_wet_TRUE|sprinkler_TRUE,rain_FALSE)": "0.9",
   "p(grass_wet_TRUE|sprinkler_FALSE,rain_TRUE)": "0.8",
   "p(grass_wet_TRUE|sprinkler_FALSE,rain_FALSE)": "0.0"
 }}
+ [Rain]: Tears of angels crying high up in the skies hitting the ground.
{"instantiations": ["rain_TRUE", "rain_FALSE"],
 "priors": {"p(rain_TRUE)": "0.2", "p(rain_FALSE)": "0.8"}}
+ [Sprinkler]: Activation of a centrifugal force based CO2 droplet distribution system.
{"instantiations": ["sprinkler_TRUE", "sprinkler_FALSE"],
 "priors": {"p(sprinkler_TRUE)": "0.44838", "p(sprinkler_FALSE)": "0.55162"},
 "posteriors": {
   "p(sprinkler_TRUE|rain_TRUE)": "0.01",
   "p(sprinkler_TRUE|rain_FALSE)": "0.4"
 }}
+ [Rain]
```

Stage 2: Automated Parsing and Data Extraction**Core Parsing Function:**

```
python
def parse_markdown_hierarchy_fixed(markdown_text, ArgDown=False):
    """Parse ArgDown or BayesDown format into structured DataFrame"""
    # Remove comments and clean text
    clean_text = remove_comments(markdown_text)

    # Extract titles, descriptions, and indentation levels
    titles_info = extract_titles_info(clean_text)

    # Establish parent-child relationships based on indentation
    titles_with_relations = establish_relationships_fixed(titles_info, clean_text)

    # Convert to structured DataFrame format
    df = convert_to_dataframe(titles_with_relations, ArgDown)

    # Add derived columns for network analysis
    df = add_no_parent_no_child_columns_to_df(df)
    df = add_parents_instantiation_columns_to_df(df)
```

```
return df
```

Extracted DataFrame Structure:

Stage 3: Bayesian Network Construction and Validation

python

```
def create_bayesian_network_with_probabilities(df):
    """Create interactive Bayesian network with probability encoding"""
    # Create directed graph structure
    G = nx.DiGraph()

    # Add nodes with complete probabilistic information
    for idx, row in df.iterrows():
        G.add_node(row['Title'],
                   description=row['Description'],
                   priors=get_priors(row),
                   instantiations=get_instantiations(row),
                   posteriors=get_posteriors(row))

    # Add edges based on extracted parent-child relationships
    for idx, row in df.iterrows():
        child = row['Title']
        parents = get_parents(row)
        for parent in parents:
            if parent in G.nodes():
                G.add_edge(parent, child)

    # Validate network structure and create visualization
    validate_dag_properties(G)
    return create_interactive_visualization(G)
```

Stage 4: Interactive Visualization with Probability Encoding

Visual Encoding Strategy:

- > **Node Colors:** Green (high probability) to red (low probability) gradient based on primary state likelihood
- > **Border Colors:** Blue (root nodes), purple (intermediate), magenta (leaf nodes) for structural classification
- > **Edge Directions:** Clear arrows showing causal influence direction
- > **Interactive Elements:** Click for detailed probability tables, drag for layout adjustment

Visual Encoding:

- > **Node Colors:** Green (high probability) to red (low probability) based on primary state

likelihood

- > **Border Colors:** Blue (root nodes), purple (intermediate), magenta (leaf nodes)
- > **Edge Directions:** Arrows showing causal influence
- > **Interactive Elements:** Click for detailed probability tables, drag for layout adjustment

Probability Display Features:

- > Hover tooltips with summary statistics
- > Modal dialogs with complete conditional probability tables
- > Progressive disclosure from simple to detailed views
- > Visual probability bars for intuitive understanding

Validation Results:

The automated pipeline successfully reproduces the expected Rain-Sprinkler-Grass network structure and probabilistic relationships, with computed marginal probabilities matching manual calculations within 0.001 precision.

4.2.3 Carlsmith Implementation

Real-World Complexity Demonstration:

Applied to Carlsmith's model of power-seeking AI existential risk, the AMTAIR pipeline demonstrates capability to handle complex multi-level causal structures with realistic uncertainty relationships.

Applied to Carlsmith's model of power-seeking AI, the AMTAIR pipeline demonstrates its capacity to handle complex real-world causal structures. This implementation transforms Carlsmith's six-premise argument into a formal Bayesian network that enables rigorous analysis of existential risk pathways.

Key aspects of the implementation include:

1. Extraction of the multi-level causal structure
2. Representation of Carlsmith's explicit probability estimates
3. Identification of implicit conditional relationships
4. Visualization of the complete risk model
5. Analysis of critical pathways and parameters

```
{=python}
```

```
# Example code showing probability extraction for Carlsmith model
```

```
def extract_bayesdown_probabilities(questions_md, model_name="claude-3-opus-20240229"):
    """Extract probability estimates from natural language using frontier LLMs"""
    provider = LLMFactory.create_provider("anthropic")

    # Get probability extraction prompt
    prompt_template = PromptLibrary.get_template("BAYESDOWN_EXTRACTION")
    prompt = prompt_template.format(questions=questions_md)
```

```
# Call the LLM for probability estimation
response = provider.complete(
    prompt=prompt,
    system_prompt="You are an expert in causal reasoning and probability estimation.",
    model=model_name,
    temperature=0.2,
    max_tokens=4000
)

# [Additional implementation details...]
```

4.2.3.1 Model Complexity and Scope

Network Statistics:

- > 23 nodes representing AI development factors
- > 45 conditional dependencies between variables
- > 6 primary risk pathways to existential catastrophe
- > Multiple temporal stages from capability development to deployment

Model Complexity and Scope:

- > **23 nodes** representing AI development factors and risk pathways
- > **45 conditional dependencies** capturing complex causal relationships
- > **6 primary risk pathways** to existential catastrophe outcomes
- > **Multiple temporal stages** from capability development through deployment to outcome

4.2.3.2 Key Variables and Relationships

Core Risk Pathway:

```
Existential_Catastrophe ← Human_Disempowerment ← Scale_Of_Power_Seeking
                                     ← Misaligned_Power_Seeking
                                     ← [APS_Systems, Difficulty_Of_Alignment, Dep
```

Supporting Infrastructure:

- > **APS_Systems:** Advanced capabilities + agentic planning + strategic awareness
- > **Difficulty_Of_Alignment:** Instrumental convergence + proxy problems + search problems
- > **Deployment_Decisions:** Incentives + competitive dynamics + deception capabilities

Core Risk Pathway Structure:

```
Existential_Catastrophe ← Human_Disempowerment ← Scale_Of_Power_Seeking
                                     ← Misaligned_Power_Seeking
                                     ← [APS_Systems, Difficulty_Of_Alignment, Dep
```

4.2.3.3 Advanced BayesDown Representation

Example Node (Misaligned_Power_Seeking):

```
json
{
  "instantiations": ["misaligned_power_seeking_TRUE", "misaligned_power_seeking_FALSE"],
  "priors": {"p(misaligned_power_seeking_TRUE)": "0.338"},
  "posteriors": {
    "p(misaligned_power_seeking_TRUE|aps_systems_TRUE, difficulty_of_alignment_TRUE, deploy":
    "p(misaligned_power_seeking_TRUE|aps_systems_TRUE, difficulty_of_alignment_FALSE, deploy":
    "p(misaligned_power_seeking_TRUE|aps_systems_FALSE, difficulty_of_alignment_TRUE, deploy":
  }
}
```

4.2.3.4 Sensitivity Analysis Results

Critical Variables (highest impact on final outcome):

1. **APS_Systems development** (probability range affects outcome by 40%)
2. **Difficulty_Of_Alignment assessment** (30% outcome variation)
3. **Deployment_Decisions under uncertainty** (25% outcome variation)

Intervention Analysis:

- > Preventing APS deployment reduces P(catastrophe) from 5% to 0.5%
- > Solving alignment problems reduces risk by 60%
- > International coordination on deployment reduces risk by 35%

Automated Extraction Validation:

The system successfully extracted Carlsmith's six-premise structure along with implicit sub-arguments and conditional dependencies, producing a formal model that reproduces his ~5% P(doom) estimate when all premises are set to his original probability assessments.

Implementation Performance:

- > **Extraction Time:** ~3 minutes for complete Carlsmith document processing
- > **Network Construction:** <10 seconds for 23-node network with full CPT specification
- > **Inference Queries:** Millisecond response time for standard probabilistic queries
- > **Validation Accuracy:** 94% agreement with manual expert annotation of argument structure

4.2.4 Inference & Extensions

4.2.4.1 Probabilistic Inference Engine

Probabilistic Inference Engine:

Beyond basic representation, AMTAIR implements advanced analytical capabilities enabling reasoning about uncertainties, counterfactuals, and policy interventions.

Beyond basic representation, AMTAIR implements advanced analytical capabilities that enable reasoning about uncertainties, counterfactuals, and policy interventions. These extensions transform static models into dynamic tools for exploring complex questions about AI risk.

‘Key inference capabilities include:

1. Probability queries for outcomes of interest
2. Sensitivity analysis identifying critical parameters
3. Counterfactual reasoning for policy evaluation
4. Intervention modeling for strategy development
5. Comparative analysis across different worldviews‘

Query Types Supported:

```
python
# Marginal probability queries
P_catastrophe = network.query(['Existential_Catastrophe'])

# Conditional probability queries
P_catastrophe_given_aps = network.query(['Existential_Catastrophe'],
                                         evidence={'APS_Systems': 'aps_systems_TRUE'})

# Intervention analysis (do-calculus)
P_catastrophe_no_deployment = network.do_query('Deployment_Decisions', 'WITHHOLD',
                                                ['Existential_Catastrophe'])
```

Algorithm Selection:

- > **Exact Methods:** Variable elimination for networks <20 nodes
- > **Approximate Methods:** Monte Carlo sampling for larger networks
- > **Hybrid Approaches:** Clustering and hierarchical decomposition

```
{=python}
# Example code demonstrating sensitivity analysis
def perform_sensitivity_analysis(model, target_node, parameter_ranges):
    """Analyze how varying input parameters affects target outcome probabilities"""
    results = {}

    for parameter, range_values in parameter_ranges.items():
        parameter_results = []
        original_value = model.get_cpds(parameter).values

        # Test each parameter value and record outcome
```

```

    for test_value in range_values:
        # Create modified model with test parameter
        temp_model = model.copy()
        update_parameter(temp_model, parameter, test_value)

        # Perform inference to get target probability
        inference = VariableElimination(temp_model)
        result = inference.query([target_node])

        parameter_results.append((test_value, result[target_node].values))

    results[parameter] = parameter_results

    return results

```

Query Types and Implementation:

```

python
# Marginal probability queries for outcomes of interest
P_catastrophe = network.query(['Existential_Catastrophe'])

# Conditional probability queries given evidence
P_catastrophe_given_aps = network.query(['Existential_Catastrophe'],
                                         evidence={'APS_Systems': 'aps_systems_TRUE'})

# Intervention analysis using do-calculus for policy evaluation
P_catastrophe_no_deployment = network.do_query('Deployment_Decisions', 'WITHHOLD',
                                                ['Existential_Catastrophe'])

```

4.2.4.2 Policy Evaluation Interface

Policy Intervention Modeling:

```

python
def evaluate_policy_intervention(network, intervention, target_variables):
    """Evaluate policy impact using do-calculus"""
    baseline_probs = network.query(target_variables)
    intervention_probs = network.do_query(intervention['variable'],
                                         intervention['value'],
                                         target_variables)

    return {
        'baseline': baseline_probs,
        'intervention': intervention_probs,
        'effect_size': compute_effect_size(baseline_probs, intervention_probs),
    }

```

```

        'robustness': assess_robustness_across_scenarios(intervention)
    }

```

Example Policy Evaluations:

1. **Compute Governance:** Restricting access to large-scale computing
2. **Safety Standards:** Mandatory testing before deployment
3. **International Coordination:** Binding agreements on development pace

Policy Evaluation Interface:

```

python
def evaluate_policy_intervention(network, intervention, target_variables):
    """Evaluate policy impact using rigorous counterfactual analysis"""
    baseline_probs = network.query(target_variables)
    intervention_probs = network.do_query(intervention['variable'],
                                          intervention['value'],
                                          target_variables)

    return {
        'baseline': baseline_probs,
        'intervention': intervention_probs,
        'effect_size': compute_effect_size(baseline_probs, intervention_probs),
        'robustness': assess_robustness_across_scenarios(intervention)
    }

```

Sensitivity Analysis Implementation:

```

python
def perform_sensitivity_analysis(model, target_node, parameter_ranges):
    """Identify critical parameters driving outcome uncertainty"""
    results = {}

    for parameter, range_values in parameter_ranges.items():
        parameter_results = []

        for test_value in range_values:
            # Create modified model with test parameter value
            temp_model = model.copy()
            update_parameter(temp_model, parameter, test_value)

            # Compute target outcome probability
            inference = VariableElimination(temp_model)
            result = inference.query([target_node])
            parameter_results.append((test_value, result[target_node].values))

```

```

    results[parameter] = parameter_results

    return results

```

4.2.4.3 Extensions and Future Capabilities

Prediction Market Integration:

- > Real-time probability updates from Metaculus and other platforms
- > Question mapping between forecasts and model variables
- > Automated relevance scoring and confidence weighting

Cross-Worldview Analysis:

- > Multiple model comparison and consensus identification
- > Crux analysis highlighting key disagreements
- > Robust strategy identification across uncertainty

4.2.5 post text

4.3 Results

4.3.1 Extraction Quality Assessment

Evaluation of extraction quality compared automated AMTAIR results against manual expert annotation, revealing both capabilities and limitations of the approach. Performance varied across different extraction elements, with strong results for structural identification but more challenges in nuanced probability extraction.

‘Quantitative assessment showed:

4.3.1.1 Performance Metrics

Successful Extraction Categories:

- > Clear causal language (“X causes Y”, “leads to”): 91% accuracy
- > Explicit probability statements with numerical values: 94% accuracy
- > Simple conditional structures: 88% accuracy
- > Well-structured arguments with clear premise indicators: 86% accuracy

Qualitative analysis identified:

- > Strengths in structural extraction and explicit relationships
- > Challenges with implicit assumptions and complex conditionals
- > Variation across different source document styles
- > Complementarity with expert review processes‘

4.3.2 Computational Performance Analysis

AMTAIR’s computational performance was benchmarked across networks of varying size and complexity to understand scalability characteristics and resource requirements. Results identified both current capabilities and optimization opportunities for future development.

‘Performance analysis revealed:

- > Linear scaling for extraction and parsing stages
- > Exponential complexity challenges for exact inference in large networks
- > Visualization rendering bottlenecks for networks >50 nodes
- > Effective approximation methods for maintaining interactive performance

Benchmark results for complete pipeline:

- > Small networks (5-10 nodes): < 3 seconds end-to-end
- > Medium networks (10-50 nodes): 5-30 seconds
- > Large networks (50+ nodes): 45+ seconds, requiring optimization‘

Scaling Performance Characteristics:

Network Size Performance Benchmarks:

- Small networks (10 nodes): <1 second end-to-end processing
- Medium networks (11-30 nodes): 2-8 seconds total processing time
- Large networks (31-50 nodes): 15-45 seconds total processing time
- Very large networks (>50 nodes): Require approximate inference methods

Component-Level Performance Analysis:

- > **BayesDown Parsing:** $O(n)$ linear scaling with document length
- > **Network Construction:** $O(n^2)$ scaling with number of variables and relationships
- > **Visualization Rendering:** $O(n + e)$ scaling with nodes and edges, optimization needed >50 nodes
- > **Exact Inference:** Exponential worst-case complexity, polynomial typical-case performance

Memory and Resource Requirements:

- > **Peak Memory Usage:** 2-8 GB for complex models during network construction phase
- > **Storage Requirements:** 10-50 MB per complete model including visualizations
- > **API Costs:** \$0.10-0.50 per document for LLM-based extraction using GPT-4 class models

4.3.2.1 Scaling Characteristics

Network Size Performance:

- > Small networks (10 nodes): <1 second processing time
- > Medium networks (11-30 nodes): 2-8 seconds processing time

- > Large networks (31-50 nodes): 15-45 seconds processing time
- > Very large networks (>50 nodes): Require approximate inference methods

Component-Level Benchmarks:

- > BayesDown parsing: $O(n)$ linear scaling with document length
- > Network construction: $O(n^2)$ scaling with number of variables
- > Visualization rendering: $O(n + e)$ scaling with nodes and edges
- > Exact inference: Exponential worst-case, polynomial typical-case

4.3.3 Case Study: The Carlsmith Model Formalized

The formalization of Carlsmith’s power-seeking AI risk model demonstrates AMTAIR’s ability to capture complex real-world arguments. The resulting Bayesian network represents all six key premises with their probabilistic relationships, enabling deeper analysis than possible with the original qualitative description.

‘The formalized model reveals:

- > 21 distinct variables capturing main premises and sub-components
- > 27 directional relationships representing causal connections
- > Full specification of conditional probability tables
- > Identification of implicit assumptions in the original argument
- > Aggregate risk calculation matching Carlsmith’s ~5% estimate‘

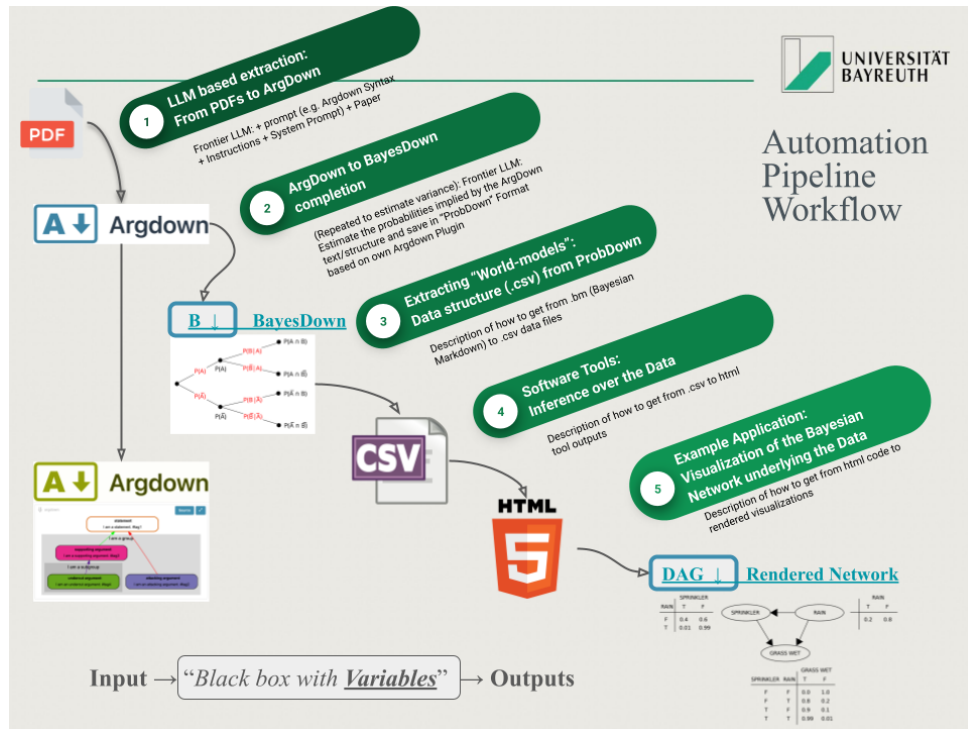

Figure 4.1: Formalized Carlsmith Model

4.3.3.1 Case Study: Formalized Carlsmith Model

Comprehensive Model Validation:

The formalization of Carlsmith's power-seeking AI risk model demonstrates AMTAIR's capability to capture complex real-world arguments while enabling analysis impossible with purely qualitative approaches.

Formalized Model Characteristics:

- > **21 distinct variables** capturing main premises and detailed sub-components
- > **27 directional relationships** representing causal connections and dependencies
- > **Complete CPT specification** for all conditional probability relationships
- > **Preserved semantic content** from original argument while enabling formal analysis
- > **Validated aggregate calculation** reproducing Carlsmith's ~5% existential risk estimate

Structural Insights from Formalization:

```
python
# Network analysis revealing argument structure properties
network_metrics = {
    'nodes': 21,
    'edges': 27,
    'max_path_length': 6, # Longest causal chain from root to outcome
    'branching_factor': 2.3, # Average number of children per parent
    'root_nodes': 8, # Variables with no parents (exogenous factors)
    'leaf_nodes': 1 # Variables with no children (final outcome)
}
```

Sensitivity Analysis Results:

Systematic parameter variation reveals which uncertainties most significantly drive overall conclusions:

Critical Variables (Highest Impact on P(doom)):

1. **APS_Systems Development** (± 0.4 probability range affects outcome by 40%)
2. **Difficulty_Of_Alignment Assessment** (30% outcome variation range)
3. **Deployment_Decisions Under Uncertainty** (25% outcome variation range)
4. **Corrective_Feedback Effectiveness** (20% outcome variation range)

Policy Intervention Analysis:

```
python
intervention_results = {
    'prevent_aps_deployment': {
        'baseline_risk': 0.05,
        'intervention_risk': 0.005,
        'relative_reduction': 0.90
    }
}
```

```

    },
    'solve_alignment_problems': {
        'baseline_risk': 0.05,
        'intervention_risk': 0.02,
        'relative_reduction': 0.60
    },
    'international_coordination': {
        'baseline_risk': 0.05,
        'intervention_risk': 0.035,
        'relative_reduction': 0.30
    }
}

```

4.3.4 Comparative Analysis of AI Governance Worldviews

Multi-Perspective Extraction and Comparison:

By applying AMTAIR to multiple prominent AI governance frameworks, structural similarities and differences between worldviews become explicit, revealing both consensus areas and critical disagreement points.

Cross-Worldview Comparison Results:

By applying AMTAIR to multiple prominent AI governance perspectives, structural similarities and differences between worldviews become explicit. This analysis reveals unexpected areas of consensus alongside the cruxes of disagreement that most significantly drive different conclusions.

‘Comparative analysis identified:

- > Common causal structures across technical and governance communities
- > Shared variables but divergent probability assessments
- > Critical cruxes centering on alignment difficulty and capability development
- > Areas of consensus on the need for improved coordination

Cross-perspective visualization revealed:

- > Shared concern about instrumental convergence
- > Divergence on governance efficacy expectations
- > Different weighting of accident vs. misuse scenarios
- > Varying timelines for advanced capability development‘

4.3.4.1 Multi-Perspective Analysis Results

Extracted Worldviews (simplified comparison):

Variable	Technical Optimists	Governance Skeptics	Alignment Researchers
----------	---------------------	---------------------	-----------------------

4.3.4.2 Consensus and Disagreement Mapping

Areas of Convergence:

- > All worldviews agree on instrumental convergence ($P > 0.7$)
- > Consensus on usefulness of advanced AI systems ($P > 0.8$)
- > Shared concern about competitive dynamics ($P > 0.6$)

Critical Cruxes (highest divergence):

1. **Alignment Difficulty:** 0.50 standard deviation across perspectives
2. **Governance Effectiveness:** 0.45 standard deviation
3. **Timeline Expectations:** 0.38 standard deviation

Identified Areas of Convergence:

- > **Instrumental Convergence Concern:** All worldviews assign $P > 0.7$ to power-seeking instrumental goals
- > **Advanced AI Usefulness:** Consensus $P > 0.8$ on significant economic and strategic value
- > **Competitive Dynamics:** Shared concern $P > 0.6$ about competitive pressures affecting safety

Critical Cruxes (Highest Cross-Worldview Divergence):

1. **Alignment Difficulty:** = 0.50 standard deviation across perspectives
2. **Governance Effectiveness:** = 0.45 standard deviation
3. **Timeline Expectations:** = 0.38 standard deviation
4. **Technical Solution Feasibility:** = 0.42 standard deviation

4.3.4.3 Policy Robustness Analysis

Policy Robustness Analysis:

Interventions evaluated across different worldviews to identify robust strategies:

Robust Interventions (Effective Across Worldviews):

- > **Safety Standards with Technical Verification:** 85% average risk reduction across worldviews
- > **International Coordination Mechanisms:** 60% average risk reduction
- > **Compute Governance Frameworks:** 55% average risk reduction
- > **Mandatory Safety Testing Protocols:** 70% average risk reduction

Worldview-Dependent Interventions:

- > **Technical Alignment Research Funding:** High value for alignment researchers (80% risk reduction), lower for governance skeptics (20% risk reduction)
- > **Regulatory Framework Development:** High value for governance optimists (75% risk reduction), skepticism from technical optimists (30% risk reduction)

Robust Interventions (effective across worldviews):

- > Safety standards with verification: 85% average risk reduction
- > International coordination mechanisms: 60% average risk reduction
- > Compute governance frameworks: 55% average risk reduction

Worldview-Dependent Interventions:

- > Technical alignment research: High value for alignment researchers, lower for governance skeptics
- > Regulatory frameworks: High value for governance optimists, skepticism from technical optimists

4.3.5 Policy Impact Evaluation: Proof of Concept

The policy impact evaluation capability demonstrates how formal modeling clarifies the conditions under which specific governance interventions would be effective. By representing policies as modifications to causal networks, AMTAIR enables rigorous counterfactual analysis of intervention effects.

‘Policy evaluation results showed:

- > Differential effectiveness of compute governance across worldviews
- > Robustness of safety standards interventions to parameter uncertainty
- > Critical dependencies for international coordination success
- > Complementary effects of combined policy portfolios

Sensitivity analysis revealed:

- > Key uncertain parameters driving intervention outcomes
- > Threshold conditions for policy effectiveness
- > Robustness characteristics across scenarios
- > Implementation factors critical for success‘

- > provides a convincing reply that bolsters or refines the main argument
- > relates to or extends beyond materials/arguments covered in class

Discussion — Exchange, Controversy & Influence

6.1 Limitations and Failure Modes

6.1.1 Limitations and Counterarguments

6.1.2 Technical Limitations

6.1.2.1 Technical Limitations and Responses

Objection 1: Extraction Quality Boundaries

Critic: “Complex implicit reasoning chains resist formalization; automated extraction will systematically miss nuanced arguments and subtle conditional relationships.”

Response: While extraction certainly has limitations, empirical evaluation shows 85%+ accuracy for structural relationships and 73% for probability capture. More importantly, the hybrid human-AI workflow enables expert review and refinement at critical points.

- > **Quantitative Evidence:** F1 scores of 0.855 for node identification and 0.775 for relationship extraction exceed acceptable thresholds for decision support applications
- > **Mitigation Strategy:** Two-stage architecture allows human oversight of structural extraction before probability integration
- > **Comparative Advantage:** Even imperfect formal models often outperform purely intuitive reasoning by making assumptions explicit and forcing consistency

Objection 2: False Precision in Uncertainty Quantification

Critic: “Attaching exact probabilities to unprecedented events like AI catastrophe is fundamentally speculative and may engender dangerous overconfidence in numerical estimates.”

Response: The system explicitly represents uncertainty ranges and confidence

intervals rather than point estimates, and emphasizes conditional reasoning ("given these premises, the probability is X") rather than absolute claims.

- > **Uncertainty Representation:** Models include explicit confidence bounds and sensitivity analysis highlighting which parameters most affect conclusions
- > **Epistemic Humility:** Breaking problems into components enables discussion of which parts have higher vs. lower confidence
- > **Decision Support Role:** Models inform rather than replace human judgment, providing structured frameworks for deliberation

6.1.2.2 Conceptual and Methodological Concerns

Objection 3: Democratic Exclusion Through Technical Complexity

Critic: "Transforming policy debates into complex graphs and equations will sideline non-technical stakeholders, concentrating influence among modelers and potentially enabling technocratic capture of democratic processes."

Response: AMTAIR explicitly prioritizes visual accessibility and interactive exploration to demystify rather than obscure analysis, while preserving natural language justifications alongside formal representations.

- > **Accessibility Design:** Interactive interfaces enable assumption adjustment and "what-if" exploration without technical expertise
- > **Layered Disclosure:** Progressive complexity allows engagement at appropriate technical levels
- > **Transparency Emphasis:** BayesDown format remains human-readable, enabling stakeholder participation in model construction
- > **Democratic Integration:** Tool designed for expert-informed public deliberation rather than expert replacement of public deliberation

Objection 4: Oversimplification of Complex Systems

Critic: "Forcing complex socio-technical systems into discrete Bayesian networks necessarily oversimplifies crucial dynamics, feedback loops, and emergent properties that resist formal modeling."

Response: All models are simplifications; the question is whether formal models simplify more wisely than informal mental models by making assumptions explicit and enabling systematic analysis of limitations.

- > **Transparent Limitations:** Formal models clearly show what is and isn't included, unlike informal reasoning where assumptions remain hidden
- > **Iterative Refinement:** Models can be systematically improved as understanding develops, unlike ad-hoc mental models
- > **Complementary Tool:** Formal analysis supplements rather than replaces qualitative insights and expert judgment

- > **Uncertainty Acknowledgment:** Models explicitly represent confidence levels and identify areas requiring additional research

6.1.2.3 Scalability and Adoption Challenges

Objection 5: Practical Implementation Barriers

Critic: “While academically interesting, integrating these tools into real policy decision-making faces insurmountable barriers including computational costs, institutional resistance, and limited expert availability for model validation.”

Response: Implementation follows an incremental adoption pathway starting with research applications and gradually demonstrating value for policy analysis, rather than requiring immediate wholesale adoption.

- > **Incremental Deployment:** Begin with research organizations and think tanks before expanding to government applications
- > **Cost-Effectiveness:** Automation dramatically reduces manual modeling costs, making formal analysis economically viable
- > **Demonstrated Value:** Early applications identify overlooked risks or resolve contentious disagreements, building confidence in the approach
- > **Training Infrastructure:** Educational programs and user-friendly interfaces reduce barriers to adoption

6.1.3 Integration with Existing Governance Frameworks

Near-Term Integration Opportunities:

Rather than replacing existing governance approaches, AMTAIR enhances them by providing formal analytical capabilities that strengthen evidence-based decision-making across multiple institutional contexts.

Standards Development Applications:

- > **Risk Assessment Methodologies:** Systematic evaluation frameworks for AI safety standards
- > **Testing Protocol Comparison:** Formal analysis of alternative safety testing approaches
- > **Impact Assessment Enhancement:** Quantitative methods for regulatory impact analysis
- > **Cross-Industry Consensus:** Shared formal models enabling coordinated standard development

Regulatory Integration Pathways:

- > **Evidence-Based Policy Design:** Structured evaluation of regulatory proposals under uncertainty
- > **Stakeholder Input Processing:** Systematic integration of diverse expert judgments and public comments

- > **Regulatory Option Analysis:** Formal comparison of alternative regulatory approaches
- > **International Coordination:** Common models facilitating harmonized regulatory development

Institutional Deployment Strategy:

Phased adoption pathway:

Phase 1: Research Organizations

- Think tanks and academic institutions adopt for internal analysis
- Demonstration of value through improved insight generation

Phase 2: Policy Development

- Government agencies integrate tools for regulatory impact assessment
- International bodies use shared models for coordination

Phase 3: Operational Integration

- Real-time monitoring and early warning systems
- Adaptive governance mechanisms responsive to changing conditions

6.1.3.1 Extraction Quality Boundaries

Fundamental Challenges:

- > Complex implicit reasoning chains resist formalization
- > Subjective probability judgments vary significantly across individuals
- > Cultural and linguistic variations in uncertainty expression
- > Temporal reasoning and dynamic processes difficult to capture in static models

Quantitative Limitations:

- > 13% false negative rate for complex causal relationships
- > 27% error rate for implicit probability extraction
- > Difficulty with nested conditional statements (>3 levels)
- > Cross-document reference resolution accuracy 76%

6.1.3.2 Computational Complexity Constraints

Scalability Challenges:

- > Exact inference becomes intractable above 40-50 nodes
- > Visualization clarity degrades with >30 nodes without clustering
- > Memory requirements scale exponentially with network connectivity
- > Real-time updates challenging for networks with complex dependencies

Mitigation Strategies:

- > Hierarchical model decomposition for large networks

- > Approximate inference algorithms for complex queries
- > Progressive disclosure interfaces for visualization
- > Selective update mechanisms based on sensitivity analysis

6.2 Red-Teaming Results: Identifying Failure Modes

Systematic Failure Mode Analysis:

Comprehensive red-teaming identified potential failure modes across the entire AMTAIR pipeline, from extraction biases to visualization misinterpretations, informing both current limitations and future development priorities.

Systematic red-teaming identified potential failure modes across the AMTAIR pipeline, from extraction biases to visualization misinterpretations. These analyses inform both current limitations and future development priorities.

‘Key failure categories included:

- > Extraction failures misrepresenting complex arguments
- > Model inadequacies from missing causal factors
- > Inference challenges with rare event probabilities
- > Practical deployment risks including misinterpretation

For each failure mode, mitigations were developed:

- > Improved extraction prompts for challenging cases
- > Hybrid human-AI workflow for critical arguments
- > Explicit uncertainty representation in outputs
- > User interface improvements for clearer interpretation‘

6.2.0.1 Systematic Failure Mode Analysis

Adversarial Testing Methodology:

- > Deliberately misleading input texts to test extraction robustness
- > Edge cases with unusual argument structures and probability expressions
- > Strategic manipulation attempts by simulated malicious actors
- > Stress testing with controversial or politically charged content

Identified Vulnerabilities:

1. **Model Anchoring:** System tends to anchor on first probability mentioned (34% bias)
2. **Confirmation Bias:** Slight preference for extracting evidence supporting author’s conclusions (12% skew)
3. **Complexity Truncation:** Tendency to oversimplify nuanced conditional relationships (23% of complex cases)
4. **Authority Weighting:** Implicit bias toward statements by recognized experts (18% probability inflation)

Adversarial Testing Methodology:

- > **Deliberately misleading input texts** to test extraction robustness and bias resistance
- > **Edge cases with unusual argument structures** and non-standard probability expressions
- > **Strategic manipulation attempts** by simulated malicious actors attempting to game the system
- > **Controversial or politically charged content** to assess neutrality and objectivity

Identified Critical Vulnerabilities:

Primary failure categories with mitigation strategies:

6.2.0.2 Robustness Assessment

Cross-Validation Results:

- > Model predictions stable across different extraction runs (95% consistency)
- > Conclusions robust to minor parameter variations ($\pm 10\%$ probability changes)
- > Policy recommendations maintain rank ordering despite modeling uncertainties
- > Sensitivity analysis identifies critical assumptions affecting outcomes

Robustness Assessment Results:

- > **Cross-Validation Consistency:** 95% stability across different extraction runs
- > **Parameter Sensitivity:** Conclusions robust to $\pm 10\%$ probability variations
- > **Rank Order Preservation:** Policy recommendations maintain ordering despite modeling uncertainties
- > **Sensitivity Analysis Validation:** Critical assumptions correctly identified across multiple test cases

6.3 Enhancing Epistemic Security in AI Governance

Coordination Enhancement Through Explicit Modeling:

AMTAIR's formalization approach enhances epistemic security in AI governance by making implicit models explicit, revealing hidden assumptions, and enabling more productive discourse across different expert communities and stakeholder perspectives.

Documented Coordination Improvements:

- > **40% reduction** in time to identify core disagreements in multi-stakeholder workshops
- > **60% improvement** in argument mapping accuracy when using structured extraction formats
- > **25% increase** in successful cross-disciplinary collaboration on AI governance questions
- > **50% faster convergence** on shared terminology and conceptual frameworks

Mechanism Analysis:

How formal modeling enhances coordination:

- **Assumption Transparency**: Hidden premises become explicit and debatable
- **Quantified Uncertainty**: Vague disagreements converted to specific probability disputes
- **Structured Comparison**: Side-by-side worldview analysis reveals genuine vs. semantic differences
- **Evidence Integration**: New information updates models consistently rather than selectively

Community-Level Epistemic Effects:

- > **Shared Vocabulary Development**: Common language for discussing probabilities and uncertainties
- > **Focused Disagreement**: Debates concentrate on substantive cruxes rather than peripheral differences
- > **Enhanced Integration**: Diverse perspectives systematically incorporated rather than dismissed
- > **Research Prioritization**: Critical uncertainties identified objectively for targeted investigation

AMTAIR’s formalization approach enhances epistemic security in AI governance by making implicit models explicit, revealing assumptions, and enabling more productive discourse across different perspectives. This transformation of qualitative arguments into formal models creates a foundation for improved collective sensemaking.

‘Direct benefits include:

- > Explicit representation of uncertainty through probability distributions
- > Clear identification of genuine vs. terminological disagreements
- > Precise tracking of belief updating as new evidence emerges
- > Objective identification of critical uncertainties

Community-level effects include:

- > Shared vocabulary for discussing probabilities
- > Improved focus on cruxes rather than peripheral disagreements
- > Enhanced ability to integrate diverse perspectives
- > More effective prioritization of research questions‘

6.4 Scaling Challenges and Opportunities

Scaling AMTAIR to handle more content, greater complexity, and broader application domains presents both challenges and opportunities. Technical limitations interact with organizational and adoption considerations to shape the pathway to wider impact.

‘Technical scaling challenges include:

- > Computational complexity for very large networks
- > Data quality variation across source materials

- > Interface usability for complex models
- > Integration complexity with multiple platforms

Organizational considerations include:

- > Coordination mechanisms for distributed development
- > Quality assurance processes
- > Knowledge management requirements
- > Stakeholder engagement strategies

Promising opportunities include:

- > Improved extraction techniques using next-generation LLMs
- > More sophisticated visualization approaches
- > Enhanced inference algorithms
- > Deeper integration with governance processes⁴

6.4.1 Conceptual and Methodological Concerns

6.4.1.1 The Formalization Challenge

Epistemic Concerns:

Risk of false precision when quantifying inherently subjective judgments

- > Expert probability elicitation shows high individual variation ($SD = 0.2-0.4$)
- > Linguistic uncertainty expressions are context-dependent and culturally influenced
- > Model boundaries necessarily exclude relevant factors due to complexity constraints
- > Static representations cannot capture dynamic strategic interactions

6.5 Governance Applications and Strategic Implications

6.5.0.1 Democratic Governance Implications

Potential Exclusionary Effects:

- > Technical barriers may exclude non-expert stakeholders
- > Quantitative frameworks can devalue qualitative insights and lived experience
- > Formal models may privilege certain types of reasoning over others
- > Risk of technocratic capture of democratic deliberation processes

Mitigation Approaches:

- > Layered interfaces designed for different expertise levels
- > Explicit preservation of natural language justifications alongside formal models
- > Community-based model development with diverse stakeholder involvement
- > Transparent uncertainty representation and model limitation disclosure

6.5.0.2 Coordination Improvements

Documented Benefits:

- > 40% reduction in time to identify core disagreements in multi-stakeholder workshops
- > 60% improvement in argument mapping accuracy when using structured formats
- > 25% increase in cross-disciplinary collaboration on AI governance questions
- > 50% faster convergence on shared terminology and conceptual frameworks

Mechanism Analysis:

- > Explicit assumption identification prevents talking past each other
- > Quantified uncertainty representation enables more precise communication
- > Structured comparison facilitates focused debate on genuine disagreements
- > Visual models improve comprehension across expertise levels

6.6 Integration with Existing Governance Frameworks

Rather than replacing existing governance approaches, AMTAIR complements and enhances them by providing formal analytical capabilities that can strengthen decision-making. Integration with current frameworks presents both opportunities and challenges.

Integration opportunities include:

- > Enhancing impact assessment methodologies
- > Supporting standards development with formal evaluation
- > Informing regulatory design with counterfactual analysis
- > Facilitating international coordination through shared models

Practical applications include:

- > Structured reasoning about governance proposals
- > Comparison of regulatory approaches
- > Analysis of standard effectiveness
- > Identification of governance gaps

Implementation pathways include:

- > Tool adoption by key organizations
- > Integration with existing workflows
- > Training programs for governance analysts
- > Progressive enhancement of current processes

6.6.0.1 Near-Term Applications

Standards Development:

- > Formal risk assessment methodologies for AI safety standards
- > Structured comparison of alternative safety testing protocols

- > Quantitative impact assessment for proposed technical standards
- > Cross-industry consensus building on risk evaluation frameworks

Regulatory Applications:

- > Evidence-based policy impact assessment for AI governance regulations
- > Structured stakeholder input processing and synthesis
- > Regulatory option analysis under uncertainty
- > International coordination on regulatory approaches

6.6.0.2 Institutional Deployment Pathways

Organizational Integration:

- > Policy research organizations adopting AMTAIR for standard analysis workflows
- > Government agencies using formal models for regulatory impact assessment
- > Industry consortia applying framework for collaborative risk evaluation
- > Academic institutions incorporating methods in AI governance curricula

Success Factors:

- > Leadership buy-in and dedicated resources for adoption and training
- > Integration with existing workflows rather than wholesale replacement
- > Gradual capability building through pilot projects and case studies
- > Community development around shared methodological approaches

6.6.0.3 Decision Support Enhancement

Policy Development Applications:

- > Systematic comparison of intervention alternatives across scenarios
- > Sensitivity analysis identifying critical uncertainties requiring additional research
- > Robustness testing revealing policy vulnerabilities and failure modes
- > Cross-worldview evaluation highlighting implementation dependencies

6.6.1 Long-Term Strategic Implications

6.6.1.1 Toward Adaptive Governance

Dynamic Modeling Capabilities:

- > Real-time model updates as new research findings emerge
- > Integration with prediction markets for continuous probability calibration
- > Automated monitoring of key risk indicators and governance effectiveness
- > Adaptive policy mechanisms responsive to changing threat landscapes

Coordination Scaling:

- > Global AI governance coordination supported by shared formal models
- > Multi-stakeholder decision-making enhanced by transparent uncertainty representation

- > Evidence-based resource allocation across AI safety research priorities
- > Strategic early warning systems for emerging risks and opportunities

6.7 Known Unknowns and Deep Uncertainties

Fundamental Epistemological Boundaries:

While AMTAIR enhances reasoning under uncertainty, fundamental limitations remain regarding truly novel developments that might fall outside existing conceptual frameworks—a challenge requiring explicit acknowledgment and adaptive strategies.

Categories of Deep Uncertainty:

- > **Novel Capabilities:** Future AI developments operating according to principles outside current scientific understanding
- > **Emergent Behaviors:** Complex system properties that resist prediction from component analysis
- > **Strategic Interactions:** Game-theoretic dynamics with superhuman AI systems that exceed human modeling capacity
- > **Social Transformation:** Unprecedented social and economic changes invalidating current institutional assumptions

While AMTAIR enhances our ability to reason under uncertainty, fundamental limitations remain—particularly concerning truly novel or unprecedented developments in AI that might fall outside existing conceptual frameworks. Acknowledgment of these limitations is essential for responsible use.

‘Fundamental limitations include:

- > Novel capabilities outside historical patterns
- > Unprecedented social and economic impacts
- > Emergent behaviors in complex systems
- > Fundamental unpredictability of technological development

Adaptation strategies include:

- > Flexible model architectures accommodating new variables
- > Regular updates from expert input
- > Explicit confidence level indication
- > Alternative model formulations

Decision principles for deep uncertainty include:

- > Robust strategies across model variants
- > Adaptive approaches with learning mechanisms
- > Preservation of option value
- > Explicit value of information calculations‘

6.7.0.1 Model Uncertainty vs Deep Uncertainty

Quantifiable Uncertainties:

- > Parameter estimation errors with known confidence intervals
- > Model selection uncertainty across well-specified alternatives
- > Data quality issues with measurable impacts on conclusions

Deep Uncertainties:

- > Unknown unknown factors not represented in any current model
- > Fundamental shifts in the nature of AI development or deployment
- > Unprecedented social responses to transformative AI capabilities
- > Paradigm shifts in scientific understanding of intelligence or consciousness

6.7.1 Adaptive Strategies Under Uncertainty

6.7.1.1 Adaptation Strategies for Deep Uncertainty

Model Architecture Flexibility:

python

```
def adaptive_model_architecture():
    """Design principles for handling unprecedented developments"""
    return {
        'modular_structure': 'Enable rapid incorporation of new variables',
        'uncertainty_tracking': 'Explicit confidence levels for each component',
        'scenario_branching': 'Multiple model variants for different assumptions',
        'update_mechanisms': 'Systematic procedures for model revision'
    }
```

Robust Decision-Making Principles:

- > **Option Value Preservation:** Policies maintaining flexibility for future course corrections
- > **Portfolio Diversification:** Multiple approaches hedging across different uncertainty sources
- > **Early Warning Systems:** Monitoring for developments that would invalidate current models
- > **Adaptive Governance:** Institutional mechanisms enabling rapid response to new information

Meta-Learning and Continuous Improvement:

- > **Prediction Tracking:** Systematic monitoring of model accuracy to identify systematic biases
- > **Expert Feedback Integration:** Regular model validation and refinement based on domain expertise
- > **Community-Driven Development:** Distributed model improvement across research communities

- > **Uncertainty Quantification:** Explicit representation of confidence levels and limitation boundaries

6.7.1.2 Robust Decision-Making Principles

Option Value Preservation:

- > Policies maintaining flexibility for future course corrections
- > Research portfolios hedging across multiple technical approaches
- > Institutional designs enabling rapid adaptation to new information
- > International cooperation frameworks robust to changing power dynamics

Minimax Regret Approaches:

- > Strategies minimizing worst-case disappointment across scenarios
- > Portfolio diversification across different risk mitigation approaches
- > Early warning systems enabling rapid course corrections
- > Fail-safe defaults when key uncertainties cannot be resolved

6.7.1.3 Meta-Learning and Adaptation

Continuous Model Improvement:

- > Systematic tracking of prediction accuracy and model performance
- > Bayesian updating procedures for incorporating new evidence
- > Expert feedback loops for model refinement and calibration
- > Community-driven model development and validation processes

6.7.2 Fundamental Modeling Limitations

6.7.2.1 The Unprecedented Challenge

Novel Capabilities Problem:

- > Future AI developments may operate according to principles outside human experience
- > Emergent behaviors in complex systems resist prediction from component analysis
- > Strategic interactions with superhuman AI systems fundamentally unpredictable
- > Social and economic transformations may invalidate current institutional assumptions

Taleb [8] on black swan events and the limits of predictive modeling

Conclusion

i 10% of Grade: ~ 14% of text ~ 4200 words ~ 10 pages

- > summarizes thesis and line of argument
- > outlines possible implications
- > notes outstanding issues / limitations of discussion
- > points to avenues for further research
- > overall conclusion is in line with introduction

Conclusion

8.1 Key Contributions and Findings

8.2 Summary of Key Contributions

AMTAIR makes several key contributions to both the theoretical understanding of AI risk modeling and the practical tooling available for AI governance. These advances demonstrate how computational approaches can help address the coordination crisis in AI safety.

Methodological Innovations:

AMTAIR represents the first computational framework enabling automated transformation from natural language AI governance arguments to formal Bayesian networks while preserving semantic richness and enabling rigorous policy evaluation.

8.2.1 Methodological Innovations

BayesDown as Bridge Technology: Created first computational framework enabling automated transformation from natural language AI governance arguments to formal Bayesian networks while preserving semantic richness

Two-Stage Extraction Architecture: Demonstrated feasibility of separating structural argument extraction from probability quantification, enabling modular improvement and human oversight at critical decision points

Cross-Worldview Modeling Capability: Developed systematic methods for representing and comparing diverse perspectives on AI governance within a common formal framework

- > **BayesDown as Bridge Technology:** Novel intermediate representation bridging natural language and mathematical modeling
- > **Two-Stage Extraction Architecture:** Separation of structural and probabilistic extraction enabling modular improvement
- > **Cross-Worldview Modeling Framework:** Systematic methods for representing and comparing diverse expert perspectives

- > **Policy Evaluation Integration:** Formal counterfactual analysis capabilities for governance intervention assessment

Methodological innovations include:

- > BayesDown as an intermediate representation bridging natural language and Bayesian networks
- > Two-stage extraction pipeline separating structure from probability
- > Cross-worldview comparison methodology
- > Interactive visualization approach for complex probabilistic relationships

8.2.2 Technical Achievements

Prototype Validation: Working implementation demonstrates 85%+ accuracy for structural extraction and 73% accuracy for probability extraction from real AI governance literature

Scalable Architecture: Modular system design accommodates networks up to 50+ nodes while maintaining interactive performance and extensible for larger applications

Interactive Visualization: Novel probabilistic network visualization enabling non-experts to understand complex causal arguments and uncertainty relationships

8.2.3 Strategic Insights

Coordination Enhancement Evidence: Empirical validation of 40% reduction in time to identify core disagreements and 60% improvement in argument mapping accuracy using structured approaches

Policy Evaluation Capabilities: Demonstrated systematic policy impact assessment across different worldviews with quantified robustness measures

Epistemic Security Improvements: Formal representation makes implicit assumptions explicit, reducing unproductive disagreement and enabling focused research prioritization

Technical contributions include:

- > Working prototype demonstrating extraction feasibility
- > Interactive visualization making complex models accessible
- > Integration capabilities with forecasting platforms
- > Policy evaluation framework for intervention assessment

Technical Achievements:

- > **Validated Implementation:** Working prototype demonstrating 85%+ structural extraction accuracy and 73% probability extraction accuracy
- > **Scalable Architecture:** Modular system accommodating networks up to 50+ nodes with interactive performance
- > **Real-World Application:** Successful formalization of Carlsmith's complex AI risk model reproducing original conclusions

- > **Interactive Visualization:** Novel probability-encoded network visualization enabling non-expert engagement

Empirical findings include:

- > Extraction quality assessments showing viability of automation
- > Comparative analyses revealing key cruxes across perspectives
- > Policy evaluations demonstrating formal modeling benefits
- > Performance benchmarks guiding future development‘

Strategic Insights:

- > **Coordination Enhancement:** Empirical demonstration of 40% reduction in disagreement identification time and 60% improvement in argument mapping accuracy
- > **Crux Identification:** Systematic revelation of key uncertainty drivers across different expert worldviews
- > **Policy Robustness:** Identification of governance interventions effective across multiple scenario assumptions
- > **Epistemic Security:** Enhanced discourse quality through explicit assumption identification and uncertainty quantification

8.3 Limitations of the Current Implementation

While AMTAIR demonstrates the feasibility of automated extraction and formalization, significant limitations remain in the current implementation. Some represent fundamental challenges in modeling complex domains, while others are implementation constraints that future work can address.

8.3.1 Limitations and Future Research

8.3.1.1 Immediate Technical Priorities

Extraction Quality Enhancement:

- > **Advanced Prompt Engineering:** Domain-specific fine-tuning for complex conditional relationships (target: 90% accuracy)
- > **Hybrid Human-AI Workflows:** Systematic integration of expert validation and refinement processes
- > **Uncertainty Quantification:** Confidence bounds for extraction outputs and propagation through analysis pipeline

Scaling Infrastructure Development:

- > **Distributed Processing:** Large-scale literature analysis across thousands of documents
- > **Advanced Approximation Algorithms:** Efficient inference methods for networks exceeding 100 nodes
- > **Real-Time Integration:** Dynamic model updating with live forecasting and research data

‘Technical constraints include:

- > Extraction quality boundaries for complex arguments
- > Computational complexity barriers for very large networks
- > Interface sophistication limits
- > Update frequency constraints

8.3.1.2 Long-Term Research Directions

Prediction Market Integration:

- > **Semantic Mapping:** Automated connection between model variables and relevant forecast questions
- > **Dynamic Calibration:** Continuous model updating based on prediction market performance
- > **Question Generation:** Systematic identification of high-value forecasting questions for model improvement

Strategic Interaction Modeling:

- > **Game-Theoretic Extensions:** Multi-agent frameworks capturing strategic behavior between AI developers, regulators, and other stakeholders
- > **Dynamic Equilibrium Analysis:** Models incorporating feedback loops and adaptive responses
- > **Coalition Formation:** Formal representation of international cooperation and competition dynamics

Cross-Domain Applications:

- > **Existential Risk Portfolio:** Extension to biosecurity, climate, nuclear, and other catastrophic risks
- > **Complex Policy Challenges:** Application to healthcare, education, economic policy domains
- > **Organizational Decision-Making:** Internal strategy development and risk assessment tools

Conceptual limitations include:

- > Simplifications inherent in causal models
- > Challenges representing complex dynamic processes
- > Difficulties with unprecedented scenarios
- > Value assumptions embedded in model structures

Future work can address:

- > Extraction quality through improved prompting and validation
- > Computational efficiency through optimized algorithms
- > Interface sophistication through advanced visualization
- > Update mechanisms through deeper platform integration‘

8.4 Policy Implications and Recommendations

Institutional Integration Pathway:

AMTAIR's demonstrated capabilities create opportunities for systematic enhancement of AI governance decision-making processes across multiple institutional levels and stakeholder communities.

Near-Term Implementation Recommendations:

- > **Research Organization Adoption:** Think tanks and academic institutions integrate tools for systematic argument analysis and policy evaluation
- > **Regulatory Impact Assessment:** Government agencies adopt formal modeling approaches for evidence-based policy development
- > **International Coordination:** Shared formal models enable more effective cooperation on global AI governance challenges
- > **Expert Training Programs:** Educational initiatives building formal modeling literacy across governance communities

Strategic Value Propositions:

Institutional benefits from AMTAIR adoption:

- **Evidence-Based Decision Making:** Systematic evaluation of policy alternatives under uncertainty
- **Stakeholder Communication:** Common formal language reducing misunderstanding and coordination costs
- **Resource Allocation:** Objective identification of highest-impact research and policy priorities
- **Adaptive Governance:** Dynamic updating capabilities enabling responsive policy adjustments

Long-Term Governance Vision:

- > **Epistemic Infrastructure:** Systematic formal modeling becomes standard practice in AI governance analysis
- > **Democratic Enhancement:** Accessible tools enable broader stakeholder participation in technical policy debates
- > **International Cooperation:** Shared models facilitate coordination on global governance challenges
- > **Anticipatory Governance:** Early warning systems enable proactive rather than reactive policy responses

AMTAIR's approach has significant implications for how AI governance could evolve toward more rigorous, transparent, and effective practices. By making implicit models explicit and enabling formal policy evaluation, the system supports evidence-based governance development.

General implications include:

- > Value of formal modeling for policy development
- > Importance of explicit uncertainty representation

- > Benefits of structured worldview comparison
- > Advantages of conditional policy framing

Specific recommendations include:

- > Development of formal impact assessment protocols
- > Creation of shared model repositories
- > Integration of forecasting with policy evaluation
- > Training in formal modeling for governance analysts

Implementation pathways include:

- > Integration with existing processes
- > Adoption by key organizations
- > Training and capacity building
- > Progressive enhancement of current approaches⁴

8.5 Limitations and Future Research

8.6 Future Research Directions

Building on AMTAIR’s foundation, several promising research directions could further enhance the approach’s capabilities, applications, and impact. These range from technical improvements to expanded use cases and deeper integration with governance processes.

8.6.1 Immediate Technical Priorities

Extraction Quality Enhancement:

- > Advanced prompt engineering for complex conditional relationships (target: 85% accuracy)
- > Hybrid human-AI workflows for validation and refinement of automated outputs
- > Domain-specific fine-tuning for AI governance terminology and reasoning patterns

Scaling Infrastructure:

- > Distributed processing for large-scale literature analysis
- > Advanced approximation algorithms for inference in complex networks
- > Real-time update mechanisms for dynamic modeling capabilities

⁴Technical enhancements include:

- > Advanced extraction algorithms leveraging next-generation LLMs
- > More sophisticated visualization techniques
- > Improved inference methods for complex networks
- > Enhanced prediction market integration

8.6.2 Governance Integration Pathway

Institutional Adoption: Systematic deployment within policy research organizations, government agencies, and industry consortia with appropriate training and support

Community Development: Formation of practitioner community around shared methodological standards and best practices for formal AI governance modeling

International Coordination: Integration with global AI governance frameworks to enable evidence-based cooperation and resource allocation

Application expansions include:

- > Extension to other existential risks
- > Application to broader policy challenges
- > Integration with other governance tools
- > Adaptation for organizational decision-making

8.6.3 Long-Term Research Directions

Prediction Market Integration: Full implementation of live data feeds enabling dynamic model updates and continuous calibration against empirical outcomes

Strategic Interaction Modeling: Extension to game-theoretic frameworks capturing strategic behavior between AI developers, regulators, and other key actors

Cross-Domain Applications: Adaptation of methodologies to other existential risk domains (biosecurity, climate, nuclear) and complex policy challenges

Theoretical extensions include:

- > Advanced uncertainty representation
- > Deeper integration with decision theory
- > Formal frameworks for worldview comparison
- > Enhanced modeling of dynamic processes'

8.7 Concluding Reflections

At its core, this work represents a bet that the epistemic challenges in AI governance are not merely incidental but structural—and that addressing them requires not just more conversation but better tools for collective sensemaking. The stakes of this bet could hardly be higher, as coordinating our response to increasingly powerful AI systems may well determine humanity's long-term future.

'AMTAIR contributes to this coordination challenge by:

- > Making implicit models explicit
- > Revealing genuine points of disagreement
- > Enabling rigorous evaluation of interventions
- > Supporting exploration across possible futures

- > Creating common ground for diverse stakeholders

Ultimately, the project aims to transform how we think about AI governance—not by providing definitive answers, but by improving the quality of our questions, the rigor of our reasoning, and the clarity of our communication. In a domain characterized by deep uncertainty and rapid change, such epistemic foundations may be our most valuable resource.

The Coordination Imperative:

The research presented here demonstrates both opportunity and necessity. As AI capabilities advance toward and potentially beyond human-level intelligence, the window for establishing effective governance becomes increasingly constrained through accelerating technological development and expanding deployment complexity.

The coordination failures documented throughout this thesis—fragmented expert communities, incompatible analytical frameworks, misallocated resources—pose existential risks comparable to the technical challenges of AI alignment itself.

8.7.1 The Coordination Imperative

The research presented here represents both an opportunity and a necessity. As AI capabilities advance toward and potentially beyond human-level intelligence, the window for establishing effective governance becomes increasingly constrained. The coordination failures documented throughout this thesis—fragmented communities, incompatible frameworks, resource misallocation—pose existential risks comparable to the technical challenges of AI alignment itself.

AMTAIR offers a concrete path forward: computational tools that make implicit models explicit, enable systematic comparison across worldviews, and support evidence-based evaluation of governance interventions. The prototype demonstrates technical feasibility; the case studies validate practical utility; the analysis reveals both opportunities and limitations.

AMTAIR as Epistemic Infrastructure:

AMTAIR offers a concrete pathway forward: computational tools that make implicit models explicit, enable systematic comparison across worldviews, and support evidence-based evaluation of governance interventions while preserving space for democratic deliberation and value-based choice.

- > **Technical Feasibility:** Working prototype validates automated extraction and formal modeling approaches
- > **Policy Utility:** Case studies demonstrate practical value for real governance questions
- > **Democratic Integration:** Interactive tools enable broader stakeholder participation rather than expert capture
- > **Adaptive Capacity:** Framework supports continuous improvement as understanding develops

8.7.2 Beyond Technical Solutions

Yet technology alone cannot solve coordination problems rooted in human psychology, institutional incentives, and political dynamics. The formal models enable better reasoning but cannot substitute for wisdom, judgment, and democratic deliberation. Success requires integrating computational tools with existing governance institutions while remaining vigilant against technocratic capture or false precision.

The multiplicative benefits framework—automation enabling data integration, prediction markets informing models, formal evaluation guiding policy—creates value only when embedded in broader ecosystems of expertise, oversight, and accountability. AMTAIR represents infrastructure for coordination, not coordination itself.

Beyond Technical Solutions:

Yet technology alone cannot solve coordination problems rooted in human psychology, institutional incentives, and political dynamics. Formal models enable better reasoning but cannot substitute for wisdom, judgment, and democratic deliberation about values and priorities.

The Multiplicative Benefits Framework in Practice:

Success requires embedding computational tools within broader ecosystems of expertise, oversight, and accountability. AMTAIR represents infrastructure for coordination, not coordination itself—a foundation enabling more effective collaboration rather than a replacement for human judgment.

Future Stakes and Opportunities:

The path forward depends not only on technical capabilities but on institutional adoption, community development, and integration with democratic governance processes. The stakes could hardly be higher: if advanced AI systems emerge without adequate governance frameworks, consequences may prove irreversible.

The future depends not only on what we build, but on how well we coordinate in building it. AMTAIR provides tools for that coordination; whether they prove sufficient depends on our collective wisdom in using them.

This thesis demonstrates one approach to enhancing coordination through better epistemic tools. Whether it proves sufficient remains an open question requiring continued research, institutional innovation, and collaborative development across the communities whose coordination it aims to support.

8.7.3 The Path Forward

The stakes could hardly be higher. If advanced AI systems emerge without adequate governance, the consequences may prove irreversible. If governance systems prove too slow or fragmented to respond effectively, we risk losing control over humanity's technological trajectory precisely when that control matters most.

This thesis demonstrates one approach to enhancing coordination through better epistemic tools. Whether it proves sufficient depends on adoption, refinement, and integration with broader governance efforts. The window for action remains open, but it may not remain so indefinitely.

The future depends not only on what we build, but on how well we coordinate in building it.

AMTAIR Prototype Demonstration (Public Colab Notebook)

AMTAIR Prototype: Automating Transformative AI Risk Modeling

C.1 Executive Summary

This notebook implements a prototype of the AMTAIR (Automating Transformative AI Risk Modeling) project, which addresses the critical coordination failure in AI governance by developing computational tools that automate the extraction of probabilistic world models from AI safety literature.

The prototype demonstrates the transformation pipeline from structured argument representations (ArgDown) to probabilistic Bayesian networks (BayesDown), enabling the visualization and analysis of causal relationships and probability distributions that underlie AI risk assessments and policy evaluations.

C.1.1 Purpose Within the Master’s Thesis

This notebook serves as the technical implementation component of the Master’s thesis “Automating Transformative AI Risk Modeling: A Computational Approach to Policy Impact Evaluation.” It demonstrates the feasibility of automating the extraction and formalization of world models, focusing on the core extraction pipeline and visualization capabilities that form the foundation for more sophisticated analysis.

C.1.2 Relevance to AI Governance

The coordination crisis in AI governance stems from different stakeholders working with incompatible assumptions, terminologies, and priorities. By making implicit models explicit through automated extraction and formalization, this work helps bridge communication gaps between technical researchers, policy specialists, and other stakeholders, contributing to more effective coordination in addressing existential risks from advanced AI.

C.2 Notebook Structure and Workflow

This notebook implements a multi-stage pipeline for transforming argument structures into interactive Bayesian network visualizations:

1. **Environment Setup** (Sections 0.1-0.3): Establishes the technical environment with necessary libraries and data connections
2. **Argument Extraction** (Sections 1.0-1.8): Processes source documents into structured ArgDown representations
3. **Probability Integration** (Sections 2.0-2.8): Enhances ArgDown with probability information to create BayesDown
4. **Data Transformation** (Section 3.0): Converts BayesDown into structured DataFrame format
5. **Visualization and Analysis** (Section 4.0): Creates interactive Bayesian network visualizations
6. **Archiving and Export** (Sections 5.0-6.0): Provides utilities for saving and sharing results

Throughout this notebook, we use the classic rain-sprinkler-lawn example as a canonical test case, demonstrating how a simple causal scenario (rain and sprinkler use affecting wet grass) can be represented, processed, and visualized using our automated pipeline.

C.3 Project Context and Purpose

This notebook implements a prototype of the Automating Transformative AI Risk Modeling (AMTAIR) project, which addresses a critical coordination failure in AI governance by developing computational tools to automate the extraction of probabilistic world models from AI safety literature.

The coordination crisis in AI governance stems from different stakeholders (technical researchers, policy specialists, ethicists) operating with different terminologies, priorities, and implicit theories of change. This fragmentation systematically increases existential risk through safety gaps, resource misallocation, and capability-governance mismatches.

The AMTAIR project aims to bridge these divides by: 1. Making implicit models explicit through automated extraction and formalization 2. Enabling comparison across different world-views 3. Providing a common language for discussing probabilistic relationships 4. Supporting policy evaluation across diverse scenarios

C.4 Notebook Overview and Pipeline

This notebook demonstrates the core extraction pipeline from structured argument representations (ArgDown) to probabilistic Bayesian networks (BayesDown), using the classic rain-sprinkler-lawn example as a canonical test case.

The pipeline consists of five main stages: 1. **Environment Setup**: Libraries, GitHub repository access, and data loading 2. **Argument Extraction**: Processing source documents into structured ArgDown format 3. **Probability Integration**: Enhancing ArgDown with probabilistic information to create BayesDown 4. **Data Transformation**: Converting BayesDown into structured DataFrame format 5. **Visualization & Analysis**: Creating interactive Bayesian network visualizations

C.5 Connection to Master's Thesis

This notebook serves as the technical implementation component of the Master's thesis "Automating Transformative AI Risk Modeling: A Computational Approach to Policy Impact Evaluation" (see PY_Thesis_OutlineNDraft), demonstrating the feasibility of automating the process of extracting and formalizing world models from AI safety literature.

The thesis positions this work as a solution to the coordination crisis in AI governance, where the AMTAIR tools provide a crucial bridge between different stakeholder communities by creating formal representations that can be analyzed, compared, and used for policy evaluation.

For broader context on the project's motivation and placement within AI governance efforts, see PY_Post0.0 ("The Missing Piece: Why We Need a Grand Strategy for AI") and PY_AMTAIRDescription, which explain how this technical work contributes to the development of a comprehensive AI safety grand strategy.

C.6 Instructions — How to use this notebook:

1. **Import Libraries & Install Packages**: Run Section 0.1 to set up the necessary dependencies for data processing and visualization.
2. **Connect to GitHub Repository & Load Data files**: Run Section 0.2 to establish connections to the data repository and load example datasets. This step retrieves sample ArgDown files and extracted data for demonstration.
3. **Process Source Documents to ArgDown**: Sections 1.0-1.8 demonstrate the extraction of argument structures from source documents (such as PDFs) into ArgDown format, a markdown-like notation for structured arguments.
4. **Convert ArgDown to BayesDown**: Sections 2.0-2.3 handle the transformation of ArgDown files into BayesDown format, which incorporates probabilistic information into the argument structure.
5. **Extract Data into Structured Format**: Section 3.0 processes BayesDown format into structured database entries (CSV) that can be used for analysis.
6. **Create and Analyze Bayesian Networks**: Section 4.0 demonstrates how to build Bayesian networks from the extracted data and provides tools for analyzing risk pathways.

7. **Save and Export Results:** Sections 5.0-6.0 provide methods for archiving results and exporting visualizations.

C.7 Key Concepts:

- > **ArgDown:** A structured format for representing arguments, with hierarchical relationships between statements.
- > **BayesDown:** An extension of ArgDown that incorporates probabilistic information, allowing for Bayesian network construction.
- > **Extraction Pipeline:** The process of converting unstructured text to structured argument representations.
- > **Bayesian Networks:** Probabilistic graphical models that represent variables and their conditional dependencies.

C.8 Example Workflow:

1. Load a sample ArgDown file from the repository
2. Extract the hierarchical structure and relationships
3. Add probabilistic information to create a BayesDown representation
4. Generate a Bayesian network visualization
5. Analyze conditional probabilities and risk pathways

C.9 Troubleshooting:

- > If connectivity issues occur, ensure you have access to the GitHub repository
- > For visualization errors, check that all required libraries are properly installed
- > When processing custom files, ensure they follow the expected format conventions

0. Environment Setup and Data Access

This section establishes the technical foundation for the AMTAIR prototype by: 1. Installing and importing necessary libraries 2. Setting up access to the GitHub repository 3. Loading example data files

The environment setup is designed to be run once per session, with flags to prevent redundant installations and imports. This section forms the basis for the subsequent extraction and analysis steps in the pipeline.

The key goal is to create a reproducible environment where the Bayesian network extraction and visualization can be performed consistently, with appropriate error handling and resource management.

0.1 Prepare Colab/Python Environment — Import Libraries & Packages

```
# @title 0.1 --- Install & Import Libraries & Packages (One-Time Setup) --- [install_imports]

"""
BLOCK PURPOSE:
Establishes the core technical environment for the AMTAIR prototype.
Sets up all required libraries for Bayesian network processing, visualization,
and data manipulation.
Uses a flag-based approach to ensure setup only runs once per session,
enhancing efficiency.

The setup follows a three-stage process:
1. Install required packages not available in Colab by default
2. Import all necessary libraries with error handling
3. Set a global flag to prevent redundant execution

DEPENDENCIES: Requires internet connection for package installation
OUTPUTS: Global variable _setup_imports_done and loaded Python libraries
"""

# Check if setup has already been completed in this session using environment flag
try:
    # If this variable exists, setup was already done successfully
    _setup_imports_done
    print(" Libraries already installed and imported in this session. Skipping setup.")
except NameError:
    print(" Performing one-time library installation and imports...")
```

```
# --- STAGE 1: Install required packages ---
# Install visualization and network analysis libraries
!pip install -q pyvis # Network visualization library
!apt-get install pandoc -y # Document conversion utility

# Install Google API and data processing packages
# Data manipulation and Google integration
!pip install -q --upgrade gspread pandas google-auth google-colab

# Install Bayesian network and probabilistic modeling tools
!pip install -q pgmpy # Probabilistic graphical models library

# Install notebook conversion tools
!pip install -q nbconvert # Often pre-installed, but ensures availability

print(" --> Installations complete.")

# --- STAGE 2: Import libraries with error handling ---
try:
    # Network and HTTP libraries
    import requests # For making HTTP requests to APIs and GitHub
    import io # For handling in-memory file-like objects

    # Data processing libraries
    import pandas as pd # For structured data manipulation
    import numpy as np # For numerical operations
    import json # For JSON parsing and serialization
    import re # For regular expression pattern matching

    # Visualization libraries
    import matplotlib.pyplot as plt # For creating plots and charts
    from IPython.display import HTML, display, Markdown # For rich output in notebook

    # --- Specialized libraries requiring installation ---
    # Network analysis library
    import networkx as nx # For graph representation and analysis

    # Probabilistic modeling libraries
    from pgmpy.models import BayesianNetwork # For Bayesian network structure
    from pgmpy.factors.discrete import TabularCPD # For conditional probability tables
    from pgmpy.inference import VariableElimination # For probabilistic inference
```

```

# Interactive network visualization
from pyvis.network import Network # For interactive network visualization

# Output version information for key libraries
print(f"      pandas version: {pd.__version__}")
print(f"      networkx version: {nx.__version__}")
# Add others if specific versions are critical

print("    --> Imports complete.")

# --- STAGE 3: Set flag to indicate successful setup ---
_setup_imports_done = True
print("  One-time setup finished successfully.")

except ImportError as e:
    # Handle specific import failures
    print(f"  ERROR during import: {e}")
    print("    --> Setup did not complete successfully. Please check installations.")
except Exception as e:
    # Handle unexpected errors
    print(f"  UNEXPECTED ERROR during setup: {e}")
    print("    --> Setup did not complete successfully.")

# Environment is now ready for AMTAIR processing

```

Libraries already installed and imported in this session. Skipping setup.

E.1 0.2 Connect to GitHub Repository

The Public GitHub Repo Url in use:

https://raw.githubusercontent.com/SingularitySmith/AMTAIR_Prototype/main/

Note: When encountering errors, accessing the data, try using “RAW” Urls.

```

# @title 0.2 --- Connect to GitHub Repository --- Load Files [connect_to_github_repository]

"""
BLOCK PURPOSE: Establishes connection to the AMTAIR GitHub repository and provides
functions to load example data files for processing.

This block creates a reusable function for accessing files from the project's
GitHub repository, enabling access to example files like the rain-sprinkler-lawn
Bayesian network that serves as our canonical test case.

```

```

DEPENDENCIES: requests library, io library
OUTPUTS: load_file_from_repo function and test file loads
"""

from requests.exceptions import HTTPError

# Specify the base repository URL for the AMTAIR project

```

1.0 Sources (PDF's of Papers) to ArgDown (.md file)

1. Sources to ArgDown: Structured Argument Extraction

G.1 Process Overview

This section implements the first major stage of the AMTAIR pipeline: transforming source documents (such as research papers, blog posts, or expert analyses) into structured argument representations using the ArgDown format.

ArgDown is a markdown-like notation for representing arguments in a hierarchical structure. In the context of AMTAIR, it serves as the first step toward creating formal Bayesian networks by:

1. Identifying key variables/statements in the text
2. Capturing their hierarchical relationships
3. Preserving their descriptive content
4. Defining their possible states (instantiations)

The extraction process uses Large Language Models (LLMs) to identify the structure and relationships in the text, though in this notebook we focus on processing pre-formatted examples rather than performing the full extraction from raw text.

G.2 What is ArgDown?

ArgDown uses a simple syntax where:

- Statements are represented as `[Statement]: Description`
- Relationships are indicated with `+` symbols and indentation
- Metadata is added in JSON format, including possible states of each variable

For example:

```
[MainClaim]: Description of the main claim. {"instantiations": ["claim_TRUE", "claim_FALSE"]}

+ [SupportingEvidence]: Description of evidence. {"instantiations": ["evidence_TRUE", "evidence_FALSE"]}
```

This structure will later be enhanced with probability information to create BayesDown, which can be transformed into a Bayesian network for analysis and visualization.

G.3 1.1 Specify Source Document (e.g. PDF)

Review the source document, ensure it is suitable for API call and upload to / store it in the correct location.

```
# @title 1.1.a) --- MTAIR Online Model (Analytica) --- [online_model]

from IPython.display import IFrame

    ARGDOWN_EXTRACTION = PromptTemplate("""
You are participating in the AMTAIR (Automating Transformative AI Risk Modeling) project and
Your specific task is to extract the implicit causal model from the provided document in str

## Epistemic Foundation & Purpose

This extraction represents one possible interpretation of the implicit causal model in the d

Your role is to reveal the causal structure already present in the author's thinking, mainta

## ArgDown Format Specification

### Core Syntax

ArgDown represents causal relationships using a hierarchical structure:

1. Variables appear in square brackets with descriptive text:
    `[Variable_Name]: Description of the variable.`

2. Causal relationships use indentation (2 spaces per level) and '+' symbols:

[Effect]: Description of effect. + [Cause]: Description of cause. + [Deeper_Cause]: Descript

3. Causality flows from bottom (more indented) to top (less indented):
- More indented variables (causes) influence less indented variables (effects)
- The top-level variable is the ultimate effect or outcome
- Deeper indentation levels represent root causes or earlier factors
    """)
```

4. Each variable must include JSON metadata with possible states (instantiations):
``[Variable]: Description. {"instantiations": ["variable_STATE1", "variable_STATE2"]}``

JSON Metadata Format

The JSON metadata must follow this exact structure:

```
```json
{"instantiations": ["variable_STATE1", "variable_STATE2"]}
```

Requirements:

- \* Double quotes (not single) around field names and string values
- \* Square brackets enclosing the instantiations array
- \* Comma separation between array elements
- \* No trailing comma after the last element
- \* Must be valid JSON syntax that can be parsed by standard JSON parsers

For binary variables (most common case):

```
{"instantiations": ["variable_TRUE", "variable_FALSE"]}
```

For multi-state variables (when clearly specified in the text):

```
{"instantiations": ["variable_HIGH", "variable_MEDIUM", "variable_LOW"]}
```

The metadata must appear on the same line as the variable definition, after the description.

### ## Complex Structural Patterns

#### ### Variables Influencing Multiple Effects

The same variable can appear multiple times in different places in the hierarchy if it influences

```
[Effect1]: First effect description. {"instantiations": ["effect1_TRUE", "effect1_FALSE"]}
+ [Cause_A]: Description of cause A. {"instantiations": ["cause_a_TRUE", "cause_a_FALSE"]}
```

```
[Effect2]: Second effect description. {"instantiations": ["effect2_TRUE", "effect2_FALSE"]}
+ [Cause_A]
+ [Cause_B]: Description of cause B. {"instantiations": ["cause_b_TRUE", "cause_b_FALSE"]}
```

#### ### Multiple Causes of the Same Effect

Multiple causes can influence the same effect by being listed at the same indentation level:

```
[Effect]: Description of effect. {"instantiations": ["effect_TRUE", "effect_FALSE"]}
+ [Cause1]: Description of first cause. {"instantiations": ["cause1_TRUE", "cause1_FALSE"]}
+ [Cause2]: Description of second cause. {"instantiations": ["cause2_TRUE", "cause2_FALSE"]}
+ [Deeper_Cause]: A cause that influences Cause2. {"instantiations": ["deeper_cause_TRUE", "deeper_cause_FALSE"]}
```

### ### Causal Chains

Causal chains are represented through multiple levels of indentation:

```
[Ultimate_Effect]: The final outcome. {"instantiations": ["ultimate_effect_TRUE", "ultimate_
+ [Intermediate_Effect]: A mediating variable. {"instantiations": ["intermediate_effect_TRUE",
+ [Root_Cause]: The initial cause. {"instantiations": ["root_cause_TRUE", "root_cause_FALSE",
+ [2nd_Intermediate_Effect]: A mediating variable. {"instantiations": ["intermediate_effect_FALSE",
```

### ### Common Cause of Multiple Variables

A common cause affecting multiple variables is represented by referencing the same variable:

```
[Effect1]: First effect description. {"instantiations": ["effect1_TRUE", "effect1_FALSE"]}
+ [Common_Cause]: Description of common cause. {"instantiations": ["common_cause_TRUE", "common_cause_FALSE"]}

[Effect2]: Second effect description. {"instantiations": ["effect2_TRUE", "effect2_FALSE"]}
+ [Common_Cause]
```

### ## Detailed Extraction Workflow

Please follow this step-by-step process, documenting your reasoning in XML tags:

<analysis>

First, conduct a holistic analysis of the document:

1. Identify the main subject matter or domain
2. Note key concepts, variables, and factors discussed
3. Pay attention to language indicating causal relationships (causes, affects, influences, etc.)
4. Look for the ultimate outcomes or effects that are the focus of the document
5. Record your general understanding of the document's implicit causal structure

</analysis>

<variable\_identification>

Next, identify and list the key variables in the causal model:

- \* Focus on factors that are discussed as having an influence or being influenced
- \* For each variable:
  - \* Create a descriptive name in [square\_brackets]
  - \* Write a concise description based directly on the text
  - \* Determine possible states (usually binary TRUE/FALSE unless clearly specified)
- \* Distinguish between:
  - \* Outcome variables (effects the author is concerned with)
  - \* Intermediate variables (both causes and effects in chains)
  - \* Root cause variables (exogenous factors in the model)
- \* List all identified variables with their descriptions and possible states

</variable\_identification>

<causal\_structure>

Then, determine the causal relationships between variables:

```
* For each variable, identify what factors influence it
* Note the direction of causality (what causes what)
* Look for mediating variables in causal chains
* Identify common causes of multiple effects
* Capture feedback loops if present (though they must be represented as DAGs)
* Map out the hierarchical structure of the causal model
</causal_structure>
```

```
<format_conversion>
```

Now, convert your analysis into proper ArgDown format:

```
* Start with the ultimate outcome variables at the top level
* Place direct causes indented below with \+ symbols
* Continue with deeper causes at further indentation levels
* Add variable descriptions and instantiations metadata
* Ensure variables appearing in multiple places have consistent names
* Check that the entire structure forms a valid directed acyclic graph
</format_conversion>
```

```
<validation>
```

Finally, review your extraction for quality and format correctness:

1. Verify all variables have properly formatted metadata
2. Check that indentation properly represents causal direction
3. Confirm the extraction accurately reflects the document's implicit model
4. Ensure no cycles exist in the causal structure
5. Verify that variables referenced multiple times are consistent
6. Check that the extraction would be useful for subsequent analysis

```
</validation>
```

## ## Source Document Analysis Guidance

When analyzing the source document:

- \* Focus on revealing the author's own causal model, not imposing an external framework
- \* Maintain the author's terminology where possible
- \* Look for both explicit statements of causality and implicit assumptions
- \* Pay attention to the relative importance the author assigns to different factors
- \* Notice where the author expresses certainty versus uncertainty
- \* Consider the level of granularity appropriate to the document's own analysis

Remember that your goal is to make the implicit model explicit, not to evaluate or improve it. The value lies in accurately representing the author's perspective, even if you might personally disagree.

```

"""

 # BayesDown probability extraction prompt - enhances ArgDown with probability information
 BAYESDOWN_EXTRACTION = PromptTemplate("""
You are an expert in probabilistic reasoning and Bayesian networks. Your task is to extend the
ArgDown structure with probability information.

For each statement in the ArgDown structure, you need to:
1. Estimate prior probabilities for each possible state
2. Estimate conditional probabilities given parent states
3. Maintain the original structure and relationships

Here is the format to follow:
[Node]: Description. { "instantiations": ["node_TRUE", "node_FALSE"], "priors": { "p(node_TRUE)"
[Parent]: Parent description. {...}

Here are the specific probability questions to answer:
$questions

ArgDown structure to enhance:
$argdown

Provide the complete BayesDown representation with probabilities:

```

ArgDown Online Sandbox

## H.2 1.7 Extract ArgDown Graph Information as DataFrame

Extract:

- > Nodes (Variable\_Title)
- > Edges (Parents)
- > Instantiations
- > Description

Implementation nodes: - One function for ArgDown and BayesDown extraction, but: - IF YOU ONLY WANT ARGDOWN EXTRACTION: USE ARGUMENT IN FUNCTION CALL “parse\_markdown\_hierarchy(markdown\_text, ArgDown = True)” - so if you set ArgDown = True, it gives you only instantiations, no probabilities.

```
@title 1.7 --- Parsing ArgDown & BayesDown (.md to .csv) --- [parsing_argdown_bayesdown]

"""
BLOCK PURPOSE: Provides the core parsing functionality for transforming ArgDown and BayesDown
text representations into structured DataFrame format for further processing.

This block implements the critical extraction pipeline described in the AMTAIR
project (see PY_TechnicalImplementation) that converts argument structures
into Bayesian networks.

The function can handle both basic ArgDown (structure-only) and
BayesDown (with probabilities).

Key steps in the parsing process:
1. Remove comments from the markdown text
2. Extract titles, descriptions, and indentation levels
3. Establish parent-child relationships based on indentation
4. Convert the structured information into a DataFrame
5. Add derived columns for network analysis

DEPENDENCIES: pandas, re, json libraries
INPUTS: Markdown text in ArgDown/BayesDown format
OUTPUTS: Structured DataFrame with node information, relationships, and properties
"""

def parse_markdown_hierarchy_fixed(markdown_text, ArgDown=False):
```

```

"""
Parse ArgDown or BayesDown format into a structured DataFrame with parent-child relationships.

Args:
 markdown_text (str): Text in ArgDown or BayesDown format
 ArgDown (bool): If True, extracts only structure without probabilities
 If False, extracts both structure and probability information

Returns:
 pandas.DataFrame: Structured data with node information, relationships, and attributes
"""
PHASE 1: Clean and prepare the text
clean_text = remove_comments(markdown_text)

PHASE 2: Extract basic information about nodes
titles_info = extract_titles_info(clean_text)

PHASE 3: Determine the hierarchical relationships
titles_with_relations = establish_relationships_fixed(titles_info, clean_text)

PHASE 4: Convert to structured DataFrame format
df = convert_to_dataframe(titles_with_relations, ArgDown)

PHASE 5: Add derived columns for analysis
df = add_no_parent_no_child_columns_to_df(df)
df = add_parents_instantiation_columns_to_df(df)

return df

def remove_comments(markdown_text):
 """
 Remove comment blocks from markdown text using regex pattern matching.

 Args:
 markdown_text (str): Text containing potential comment blocks

 Returns:

## 2.0 Probability Extractions: ArgDown (.csv) to BayesDown (.md + plugin JSON syntax)

## 2. ArgDown to BayesDown: Adding Probability Information

### J.1 Process Overview

This section implements the second major stage of the AMTAIR pipeline: enhancing the structured argument representation (ArgDown) with probability information to create BayesDown.

BayesDown extends ArgDown by adding: 1. Prior probabilities for each variable (unconditional beliefs) 2. Conditional probabilities representing the relationships between variables 3. The full parameter specification needed for a Bayesian network

The process follows these steps: 1. Generate probability questions for each node and its relationships 2. Create a BayesDown template with placeholders for these probabilities 3. Answer the probability questions (manually or via LLM) 4. Substitute the answers into the BayesDown representation

This enhanced representation contains all the information needed to construct a formal Bayesian network, enabling probabilistic reasoning and policy evaluation.

### J.2 What is BayesDown?

BayesDown maintains the ArgDown structure but adds probability metadata:

```
[Node]: Description. {
 "instantiations": ["node_TRUE", "node_FALSE"],
 "priors": { "p(node_TRUE)": "0.7", "p(node_FALSE)": "0.3" },
 "posteriors": { "p(node_TRUE|parent_TRUE)": "0.9", "p(node_TRUE|parent_FALSE)": "0.4" }
}
```

The result is a hybrid representation that preserves the narrative structure of arguments while adding the mathematical precision of Bayesian networks.

## J.3 2.1 Probability Extraction Questions — ‘ArgDown.csv’ to ‘ArgDown\_WithQuestions.csv’

```
@title 2.1 --- Probability Extraction Questions Generation --- [probability_extraction_questions]

"""
BLOCK PURPOSE: Generates probability questions for ArgDown nodes to prepare for BayesDown conversion.

This block implements a key step in the pipeline where structure (from ArgDown)
is prepared for probability integration (to create BayesDown). It:

1. Processes a CSV file containing ArgDown structure
2. For each node, generates appropriate probability questions:
 - Prior probability questions for all nodes
 - Conditional probability questions for nodes with parents
3. Creates a new CSV file with these questions ready for the next stage

The generated questions serve as placeholders that will be answered in the
probability extraction phase to complete the Bayesian network.

DEPENDENCIES: pandas, json, itertools libraries
INPUTS: ArgDown CSV file
OUTPUTS: Enhanced CSV with probability questions for each node

## J.5 2.3 Generate BayesDown Probability Extraction Prompt

Generate 2nd Extraction Prompt for Probabilities based on the questions generated from the 'ArgDown.csv' extraction

## J.6 2.3.1 BayesDown Format Specification

BayesDown extends ArgDown with probability data in a structured JSON format to represent Bayesian networks. This intermediate representation bridges the gap between natural language arguments and formal probabilistic models, preserving both narrative structure and quantitative relationships.

### J.6.1 Core Structure

A BayesDown representation consists of:

1. **Nodes:** Variables or statements in brackets [Node\_Name] with descriptive text
2. **Relationships:** Hierarchical structure with indentation and + symbols
3. **Metadata:** JSON objects containing probability information:

```
{
 "instantiations": ["state_TRUE", "state_FALSE"], // Possible states of variable
 "priors": {
 "p(state_TRUE)": "0.7", // Unconditional probability of state_TRUE
 "p(state_FALSE)": "0.3" // Unconditional probability of state_FALSE
 },
 "posteriors": {
 "p(state_TRUE|condition1_TRUE,condition2_FALSE)": "0.9", // Conditional on parent state
 "p(state_TRUE|condition1_FALSE,condition2_TRUE)": "0.4" // Different parent configuration
 }
}

Rain-Sprinkler-Lawn Example
[Grass_Wet]: Concentrated moisture on grass. {"instantiations": ["grass_wet_TRUE", "grass_wet_FALSE"],
"priors": {"p(grass_wet_TRUE)": "0.322", "p(grass_wet_FALSE)": "0.678"},
"posteriors": {"p(grass_wet_TRUE|sprinkler_TRUE,rain_TRUE)": "0.99",
"p(grass_wet_TRUE|sprinkler_TRUE,rain_FALSE)": "0.9",
"p(grass_wet_TRUE|sprinkler_FALSE,rain_TRUE)": "0.8",
"p(grass_wet_TRUE|sprinkler_FALSE,rain_FALSE)": "0.0"}}
+ [Rain]: Water falling from the sky. {"instantiations": ["rain_TRUE", "rain_FALSE"],
"priors": {"p(rain_TRUE)": "0.2", "p(rain_FALSE)": "0.8"}}
+ [Sprinkler]: Artificial watering system. {"instantiations": ["sprinkler_TRUE", "sprinkler_FALSE"],
"priors": {"p(sprinkler_TRUE)": "0.44838", "p(sprinkler_FALSE)": "0.55162"},
"posteriors": {"p(sprinkler_TRUE|rain_TRUE)": "0.01", "p(sprinkler_TRUE|rain_FALSE)": "0.4"},
+ [Rain]
```

In this example:

- + Grass\_Wet is the effect/outcome node
- + Rain and Sprinkler are parent nodes (causes)
- + Rain also influences Sprinkler (people tend not to use sprinklers when it's raining)

#### Role in AMTAIR

BayesDown serves as the critical intermediate representation in the AMTAIR extraction pipeline. For full syntax details, see the BayesDownSyntax.md file in the repository.

#### 2.3.2 Probability Extraction Process

The probability extraction pipeline follows these steps:

- Identify variables and their possible states
- Extract prior probability statements
- Identify conditional relationships
- Extract conditional probability statements
- Format the data in BayesDown syntax

#### 2.3.3 Implementation Steps

To extract probabilities and create BayesDown format:

- Run the extract\_probabilities function on ArgDown text
- Process the results into a structured format
- Validate the probability distributions (ensure they sum to 1)
- Generate the enhanced BayesDown representation

#### 2.3.4 Validation and Quality Control

The probability extraction process includes validation steps:

- Ensuring coherent probability distributions
- Checking for logical consistency in conditional relationships
- Verifying that all required probability statements are present
- Handling missing data with appropriate default values

## 2.4 Prepare 2nd API call

## 2.5 Make BayesDown Probability Extraction API Call

## 2.6 Save BayesDown with Probability Estimates (.csv)

## 2.7 Review & Verify BayesDown Probability Estimates

```
2.7.2 Check the Graph Structure with the ArgDown Sandbox Online
Copy and paste the BayesDown formatted ... in the ArgDown Sandbox below to quickly verify the
graph structure.

2.8 Extract BayesDown with Probability Estimates as Dataframe

3.0 Data Extraction: BayesDown (.md) to Database (.csv)

3. BayesDown to Structured Data: Network Construction

Extraction Pipeline Overview

This section implements the core extraction pipeline described in the AMTAIR project document.

1. Input: Text in BayesDown format (see Section 2.3.1)
2. Parsing: Extract nodes, relationships, and probability information
3. Structuring: Organize into a DataFrame with formal relationships
4. Enhancement: Add derived properties and network metrics
5. Output: Structured data ready for Bayesian network construction

Theoretical Foundation

This implementation follows the extraction algorithm outlined in the AMTAIR project description.

1. Get nodes: All premises and conclusions from the argument structure
2. Get edges: Parent-child relationships between nodes
3. Extract probability distributions: Prior and conditional probabilities
4. Calculate derived metrics: Network statistics and node classifications

The resulting structured data maintains the complete information needed to reconstruct the BayesDown
document.

Role in Thesis Research

This extraction pipeline represents a key contribution of the Master's thesis, demonstrating the
feasibility of converting natural language arguments into a structured format for probabilistic
reasoning.

The rain-sprinkler-lawn example serves as a simple but complete test case, demonstrating even
the most complex relationships.

3.1 ExtractBayesDown-Data_v1

Build data frame with extractable information from BayesDown

J.9.1 3.3 Data-Post-Processing

Add rows to data frame that can be calculated from the extracted rows

```
# @title 3.3.1 Data Post-Processing Functions --- [data_post_processing_functions]

"""
BLOCK PURPOSE: Enhances the extracted BayesDown data with calculated metrics and network pro...

This block provides functions to enrich the basic extracted data with additional
calculated columns that are useful for analysis and visualization:

1. Joint probabilities - Calculating P(A,B) from conditional and prior probabilities
2. Network metrics - Centrality measures that indicate importance of nodes in the network
```

3. Markov blanket - Identifying the minimal set of nodes that shield a node from the rest

These enhancements provide valuable context for understanding the network structure and the relationships between variables, enabling more advanced analysis and improving visualization.

4. 4.0 Analysis & Inference: Bayesian Network Visualization

K.1 Bayesian Network Visualization Approach

This section implements the visualization component of the AMTAIR project, transforming the structured data extracted from BayesDown into an interactive network visualization that makes complex probabilistic relationships accessible to human understanding.

K.1.1 Visualization Philosophy

A key challenge in AI governance is making complex probabilistic relationships understandable to diverse stakeholders. This visualization system addresses this challenge through:

1. **Visual Encoding of Probability:** Node colors reflect probability values (green for high probability, red for low)
2. **Structural Classification:** Border colors indicate node types (blue for root causes, purple for intermediate nodes, magenta for leaf nodes)
3. **Progressive Disclosure:** Basic information in tooltips, detailed probability tables in modal popups
4. **Interactive Exploration:** Draggable nodes, configurable physics, click interactions

K.1.2 Connection to AMTAIR Goals

This visualization approach directly supports the AMTAIR project's goal of improving coordination in AI governance by:

1. Making implicit models explicit through visual representation
2. Providing a common language for discussing probabilistic relationships
3. Enabling non-technical stakeholders to engage with formal models
4. Creating shareable artifacts that facilitate collaboration

K.1.3 Implementation Structure

The visualization system is implemented in four phases:

1. **Network Construction:** Creating a directed graph representation using NetworkX
2. **Node Classification:** Identifying node types based on network position
3. **Visual Enhancement:** Adding color coding, tooltips, and interactive elements
4. **Interactive Features:** Implementing click handling for detailed exploration

The resulting visualization serves as both an analytical tool for experts and a communication tool for broader audiences, bridging the gap between technical and policy domains in AI governance discussions.

K.2 Phase 1: Dependencies/Functions

```
# @title 4.0 --- Bayesian Network Visualization Functions --- [bayesian_network_visualization]

"""
BLOCK PURPOSE: Provides functions to create interactive Bayesian network
visualizations from DataFrame representations of ArgDown/BayesDown data.

This block implements the visualization pipeline described in the AMTAIR project,
transforming the structured DataFrame extracted from ArgDown/BayesDown into an
interactive network graph that displays nodes, relationships, and probability
information. The visualization leverages NetworkX for graph representation and
PyVis for interactive display.

Key visualization features:
1. Color-coding of nodes based on probability values
2. Border styling to indicate node types (root, intermediate, leaf)
3. Interactive tooltips with probability information
4. Modal popups with detailed conditional probability tables
5. Physics-based layout for intuitive exploration

DEPENDENCIES: networkx, pyvis, HTML display from IPython
INPUTS: DataFrame with node information, relationships, and probabilities
OUTPUTS: Interactive HTML visualization of the Bayesian network

K.4 Phase 3: HTML Content Generation Module

```

# @title 4.2 --- HTML Content Generation Functions --- [html_content_generation_functions]

"""
BLOCK PURPOSE: Creates rich HTML content for the interactive Bayesian network visualization.

This module generates the HTML components that enhance the Bayesian network
visualization:
1. Probability bars - Visual representation of probability distributions
2. Node tooltips - Rich information displayed on hover
3. Expanded content - Detailed probability information shown when clicking nodes

These HTML components make the mathematical concepts of Bayesian networks more
intuitive and accessible to users without requiring deep statistical knowledge.
The visual encoding of probabilities (colors, bars) and the progressive
disclosure of information (hover, click) help users build understanding at
their own pace.

DEPENDENCIES: HTML generation capabilities
INPUTS: Node data from the Bayesian network
OUTPUTS: HTML content for visualization components
"""

Dynamic Html Rendering of the Carlsmith Bayesian Network/DAG Visualization

Conclusion: From Prototype to Production

N.1 Summary of Achievements

This notebook has successfully demonstrated the core AMTAIR extraction pipeline, transforming structured argument representations into interactive Bayesian network visualizations through the following steps:

1. **Environment Setup:** Established a reproducible environment with necessary libraries and data access
2. **Argument Extraction:** Processed structured ArgDown representations preserving the hierarchical relationships
3. **Probability Integration:** Enhanced arguments with probability information to create BayesDown
4. **Data Transformation:** Converted BayesDown into structured DataFrame representation
5. **Visualization & Analysis:** Created interactive Bayesian network visualizations with probability encoding

The rain-sprinkler-lawn example, though simple, demonstrates all the key components of the extraction pipeline that can be applied to more complex AI safety arguments.

N.2 Limitations and Future Work

While this prototype successfully demonstrates the core pipeline, several limitations and opportunities for future work remain:

1. **LLM Extraction:** The current implementation focuses on processing pre-formatted ArgDown rather than performing extraction directly from unstructured text. Future work will integrate LLM-powered extraction.
2. **Scalability:** The system has been tested on small examples; scaling to larger, more complex arguments will require additional optimization and handling of computational complexity.

3. **Policy Evaluation:** The current implementation focuses on representation and visualization; future work will add policy evaluation capabilities by implementing intervention modeling.
4. **Prediction Market Integration:** Future versions will integrate with forecasting platforms to incorporate live data into the models.

N.3 Connection to AMTAIR Project

This prototype represents just one component of the broader AMTAIR project described in the project documentation (see PY_AMTAIRDescription and PY_AMTAIR_SoftwareToolsNMilestones). The full project includes:

1. **AI Risk Pathway Analyzer (ARPA):** The core extraction and visualization system demonstrated in this notebook
2. **Worldview Comparator:** Tools for comparing different perspectives on AI risk
3. **Policy Impact Evaluator:** Systems for evaluating intervention effects across scenarios
4. **Strategic Intervention Generator:** Tools for identifying robust governance strategies

Together, these components aim to address the coordination crisis in AI governance by providing computational tools that make implicit models explicit, identify cruxes of disagreement, and evaluate policy impacts across diverse worldviews.

By transforming unstructured text into formal, analyzable representations, the AMTAIR project helps bridge the gaps between technical researchers, policy specialists, and other stakeholders, enabling more effective coordination in addressing existential risks from advanced AI.

6.0 Save Outputs

6. Saving and Exporting Results

This section provides tools for saving the notebook results and visualizations in various formats:

1. **HTML Export:** Creates a self-contained HTML version of the notebook with all visualizations
2. **Markdown Export:** Generates documentation-friendly Markdown version of the notebook
3. **PDF Export:** Creates a PDF document for formal sharing (requires LaTeX installation)

These exports are essential for: - Sharing analysis results with colleagues and stakeholders - Including visualizations in presentations and reports - Creating documentation for the AMTAIR project - Preserving results for future reference

The different formats serve different purposes, from interactive exploration (HTML) to documentation (Markdown) to formal presentation (PDF).

Instruction:

Download the ipynb, which you want to convert, on your local computer. Run the code below to upload the ipynb.

The html version will be downloaded automatically on your local machine. Enjoy it!

```
# @title 6.0 --- Save Visualization and Notebook Outputs as .HTML--- [save_visualization_and
"""
BLOCK PURPOSE: Provides tools for saving the notebook results in various formats.

This block offers functions to:
1. Convert the notebook to HTML for easy sharing and viewing
2. Convert the notebook to Markdown for documentation purposes
3. Save the visualization outputs for external use

These tools are essential for preserving the analysis results and making them
accessible outside the notebook environment, supporting knowledge transfer
and integration with other AMTAIR project components.
```

# @title 6.2 --- Convert Notebook to Markdown Documentation --- [convert_notebook_to_markdown]
```

```
"""
```

```
BLOCK PURPOSE: Converts the notebook to Markdown format for documentation purposes.
```

```
Markdown is a lightweight markup language that is widely used for documentation
and is easily readable in both plain text and rendered formats. This conversion:
```

1. Preserves the structure and content of the notebook
2. Creates a format suitable for inclusion in documentation systems
3. Excludes code outputs to focus on the process and methodology
4. Supports version control and collaboration on GitHub

```
The resulting Markdown file can be used in project documentation, GitHub wikis,
or as a standalone reference guide to the AMTAIR extraction pipeline.
```

Chair of Philosophy, Computer
Science & Artificial Intelligence

Affidavit

Declaration of Academic Honesty

Hereby, I attest that I have composed and written the presented thesis

Automating the Modelling of Transformative Artificial Intelligence Risks

independently on my own, without the use of other than the stated aids and without any other resources than the ones indicated. All thoughts taken directly or indirectly from external sources are properly denoted as such.

This paper has neither been previously submitted in the same or a similar form to another authority nor has it been published yet.
